# Chapter 1.

## INTRODUCTION

The cuSPARSE library contains a set of basic linear algebra subroutines used for handling sparse matrices. It is implemented on top of the NVIDIA® CUDA™ runtime (which is part of the CUDA Toolkit) and is designed to be called from C and C++. The library routines can be classified into four categories:

- ▶ Level 1: operations between a vector in sparse format and a vector in dense format
- ▶ Level 2: operations between a matrix in sparse format and a vector in dense format
- ▶ Level 3: operations between a matrix in sparse format and a set of vectors in dense format (which can also usually be viewed as a dense tall matrix)
- ▶ Conversion: operations that allow conversion between different matrix formats

The cuSPARSE library allows developers to access the computational resources of the NVIDIA graphics processing unit (GPU), although it does not auto-parallelize across multiple GPUs. The cuSPARSE API assumes that input and output data reside in GPU (device) memory, unless it is explicitly indicated otherwise by the string **DevHostPtr** in a function parameter's name (for example, the parameter **\*resultDevHostPtr** in the function **cusparses<t>doti()**).

It is the responsibility of the developer to allocate memory and to copy data between GPU memory and CPU memory using standard CUDA runtime API routines, such as **cudaMalloc()**, **cudaFree()**, **cudaMemcpy()**, and **cudaMemcpyAsync()**.

The cuSPARSE library requires hardware with compute capability (CC) of at least 1.1 or higher. Please see the *NVIDIA CUDA C Programming Guide*, Appendix A for a list of the compute capabilities corresponding to all NVIDIA GPUs.

## 1.1. Naming Conventions

The cuSPARSE library functions are available for data types **float**, **double**, **cuComplex**, and **cuDoubleComplex**. The sparse Level 1, Level 2, and Level 3 functions follow this naming convention:

```
cusparses<t>[<matrix data format>]<operation>[<output matrix data format>]
```

where `<t>` can be **S**, **D**, **C**, **Z**, or **X**, corresponding to the data types **float**, **double**, **cuComplex**, **cuDoubleComplex**, and the generic type, respectively.

The `<matrix data format>` can be **dense**, **coo**, **csr**, **csc**, or **hyb**, corresponding to the dense, coordinate, compressed sparse row, compressed sparse column, and hybrid storage formats, respectively.

Finally, the `<operation>` can be **axpyi**, **doti**, **dotci**, **gthr**, **gthrz**, **roti**, or **sctr**, corresponding to the Level 1 functions; it also can be **mv** or **sv**, corresponding to the Level 2 functions, as well as **mm** or **sm**, corresponding to the Level 3 functions.

All of the functions have the return type **cusparseStatus\_t** and are explained in more detail in the chapters that follow.

## 1.2. Asynchronous Execution

The cuSPARSE library functions are executed asynchronously with respect to the host and may return control to the application on the host before the result is ready. Developers can use the **cudaDeviceSynchronize()** function to ensure that the execution of a particular cuSPARSE library routine has completed.

A developer can also use the **cudaMemcpy()** routine to copy data from the device to the host and vice versa, using the **cudaMemcpyDeviceToHost** and **cudaMemcpyHostToDevice** parameters, respectively. In this case there is no need to add a call to **cudaDeviceSynchronize()** because the call to **cudaMemcpy()** with the above parameters is blocking and completes only when the results are ready on the host.

# Chapter 2.

## USING THE CUSPARSE API

This chapter describes how to use the cuSPARSE library API. It is not a reference for the cuSPARSE API data types and functions; that is provided in subsequent chapters.

### 2.1. Thread Safety

The library is thread safe and its functions can be called from multiple host threads.

### 2.2. Scalar Parameters

In the cuSPARSE API, the scalar parameters  $\alpha$  and  $\beta$  can be passed by reference on the host or the device.

The few functions that return a scalar result, such as `doti()` and `nnz()`, return the resulting value by reference on the host or the device. Even though these functions return immediately, similarly to those that return matrix and vector results, the scalar result is not ready until execution of the routine on the GPU completes. This requires proper synchronization be used when reading the result from the host.

This feature allows the cuSPARSE library functions to execute completely asynchronously using streams, even when  $\alpha$  and  $\beta$  are generated by a previous kernel. This situation arises, for example, when the library is used to implement iterative methods for the solution of linear systems and eigenvalue problems [3].

### 2.3. Parallelism with Streams

If the application performs several small independent computations, or if it makes data transfers in parallel with the computation, CUDA streams can be used to overlap these tasks.

The application can conceptually associate a stream with each task. To achieve the overlap of computation between the tasks, the developer should create CUDA streams using the function `cudaStreamCreate()` and set the stream to be used by each

individual cuSPARSE library routine by calling `cusparseSetStream()` just before calling the actual cuSPARSE routine. Then, computations performed in separate streams would be overlapped automatically on the GPU, when possible. This approach is especially useful when the computation performed by a single task is relatively small and is not enough to fill the GPU with work, or when there is a data transfer that can be performed in parallel with the computation.

When streams are used, we recommend using the new cuSPARSE API with scalar parameters and results passed by reference in the device memory to achieve maximum computational overlap.

Although a developer can create many streams, in practice it is not possible to have more than 16 concurrent kernels executing at the same time.

# Chapter 3.

## CUSPARSE INDEXING AND DATA FORMATS

The cuSPARSE library supports dense and sparse vector, and dense and sparse matrix formats.

### 3.1. Index Base Format

The library supports zero- and one-based indexing. The index base is selected through the `cusparseIndexBase_t` type, which is passed as a standalone parameter or as a field in the matrix descriptor `cusparseMatDescr_t` type.

### 3.2. Vector Formats

This section describes dense and sparse vector formats.

#### 3.2.1. Dense Format

Dense vectors are represented with a single data array that is stored linearly in memory, such as the following  $7 \times 1$  dense vector.

[1.0 0.0 0.0 2.0 3.0 0.0 4.0]

(This vector is referenced again in the next section.)

#### 3.2.2. Sparse Format

Sparse vectors are represented with two arrays.

- ▶ The *data array* has the nonzero values from the equivalent array in dense format.
- ▶ The *integer index array* has the positions of the corresponding nonzero values in the equivalent array in dense format.

For example, the dense vector in section 3.2.1 can be stored as a sparse vector with one-based indexing.

$$\begin{bmatrix} 1.0 & 2.0 & 3.0 & 4.0 \\ 1 & 4 & 5 & 7 \end{bmatrix}$$

It can also be stored as a sparse vector with zero-based indexing.

$$\begin{bmatrix} 1.0 & 2.0 & 3.0 & 4.0 \\ 0 & 3 & 4 & 6 \end{bmatrix}$$

In each example, the top row is the data array and the bottom row is the index array, and it is assumed that the indices are provided in increasing order and that each index appears only once.

## 3.3. Matrix Formats

Dense and several sparse formats for matrices are discussed in this section.

### 3.3.1. Dense Format

The dense matrix  $\mathbf{x}$  is assumed to be stored in column-major format in memory and is represented by the following parameters.

<b>m</b>	(integer)	The number of rows in the matrix.
<b>n</b>	(integer)	The number of columns in the matrix.
<b>ldx</b>	(integer)	The leading dimension of $\mathbf{x}$ , which must be greater than or equal to <b>m</b> . If <b>ldx</b> is greater than <b>m</b> , then $\mathbf{x}$ represents a sub-matrix of a larger matrix stored in memory
<b>x</b>	(pointer)	Points to the data array containing the matrix elements. It is assumed that enough storage is allocated for $\mathbf{x}$ to hold all of the matrix elements and that cuSPARSE library functions may access values outside of the sub-matrix, but will never overwrite them.

For example,  $\mathbf{m} \times \mathbf{n}$  dense matrix  $\mathbf{x}$  with leading dimension **ldx** can be stored with one-based indexing as shown.

$$\begin{bmatrix} X_{1,1} & X_{1,2} & \cdots & X_{1,n} \\ X_{2,1} & X_{2,2} & \cdots & X_{2,n} \\ \vdots & \vdots & \ddots & \vdots \\ X_{m,1} & X_{m,2} & \cdots & X_{m,n} \\ \vdots & \vdots & \ddots & \vdots \\ X_{ldx,1} & X_{ldx,2} & \cdots & X_{ldx,n} \end{bmatrix}$$

Its elements are arranged linearly in memory in the order below.

$$[X_{1,1} \ X_{2,1} \ \cdots \ X_{m,1} \ \cdots \ X_{ldx,1} \ \cdots \ X_{1,n} \ X_{2,n} \ \cdots \ X_{m,n} \ \cdots \ X_{ldx,n}]$$

This format and notation are similar to those used in the NVIDIA CUDA cuBLAS library.

### 3.3.2. Coordinate Format (COO)

The  $m \times n$  sparse matrix **A** is represented in COO format by the following parameters.

<b>nnz</b>	(integer)	The number of nonzero elements in the matrix.
<b>cooValA</b>	(pointer)	Points to the data array of length <b>nnz</b> that holds all nonzero values of <b>A</b> in row-major format.
<b>cooRowIndA</b>	(pointer)	Points to the integer array of length <b>nnz</b> that contains the row indices of the corresponding elements in array <b>cooValA</b> .
<b>cooColIndA</b>	(pointer)	Points to the integer array of length <b>nnz</b> that contains the column indices of the corresponding elements in array <b>cooValA</b> .

A sparse matrix in COO format is assumed to be stored in row-major format: the index arrays are first sorted by row indices and then within the same row by compressed column indices. It is assumed that each pair of row and column indices appears only once.

For example, consider the following  $4 \times 5$  matrix **A**.

$$\begin{bmatrix} 1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\ 5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\ 0.0 & 0.0 & 9.0 & 0.0 & 6.0 \end{bmatrix}$$

It is stored in COO format with zero-based indexing this way.

```
cooValA = [1.0  4.0  2.0  3.0  5.0  7.0  8.0  9.0  6.0]
cooRowIndA = [0   0   1   1   2   2   2   3   3 ]
cooColIndA = [0   1   1   2   0   3   4   2   4 ]
```

In the COO format with one-based indexing, it is stored as shown.

```
cooValA = [1.0  4.0  2.0  3.0  5.0  7.0  8.0  9.0  6.0]
cooRowIndA = [1   1   2   2   3   3   3   4   4 ]
cooColIndA = [1   2   2   3   1   4   5   3   5 ]
```

### 3.3.3. Compressed Sparse Row Format (CSR)

The only way the CSR differs from the COO format is that the array containing the row indices is compressed in CSR format. The  $m \times n$  sparse matrix **A** is represented in CSR format by the following parameters.

<b>nnz</b>	(integer)	The number of nonzero elements in the matrix.
<b>csrValA</b>	(pointer)	Points to the data array of length <b>nnz</b> that holds all nonzero values of <b>A</b> in row-major format.
<b>csrRowPtrA</b>	(pointer)	Points to the integer array of length <b>m+1</b> that holds indices into the arrays <b>csrColIndA</b> and <b>csrValA</b> . The first <b>m</b> entries of this array contain the indices of the first nonzero element in the <i>i</i> th row for $i=1, \dots, m$ , while the last entry contains $\text{nnz} + \text{csrRowPtrA}(0)$ . In general, $\text{csrRowPtrA}(0)$ is 0 or 1 for zero- and one-based indexing, respectively.

<b>csrColIndA</b>	(pointer)	Points to the integer array of length <b>nnz</b> that contains the column indices of the corresponding elements in array <b>csrValA</b> .
-------------------	-----------	---

Sparse matrices in CSR format are assumed to be stored in row-major CSR format, in other words, the index arrays are first sorted by row indices and then within the same row by column indices. It is assumed that each pair of row and column indices appears only once.

Consider again the  $4 \times 5$  matrix **A**.

$$\begin{bmatrix} 1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\ 5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\ 0.0 & 0.0 & 9.0 & 0.0 & 6.0 \end{bmatrix}$$

It is stored in CSR format with zero-based indexing as shown.

```
csrValA = [1.0  4.0  2.0  3.0  5.0  7.0  8.0  9.0  6.0]
csrRowPtrA = [0   2   4   7   9 ]
csrColIndA = [0   1   1   2   0   3   4   2   4 ]
```

This is how it is stored in CSR format with one-based indexing.

```
csrValA = [1.0  4.0  2.0  3.0  5.0  7.0  8.0  9.0  6.0]
csrRowPtrA = [1   3   5   8  10 ]
csrColIndA = [1   2   2   3   1   4   5   3   5 ]
```

### 3.3.4. Compressed Sparse Column Format (CSC)

The CSC format is different from the COO format in two ways: the matrix is stored in column-major format, and the array containing the column indices is compressed in CSC format. The  $m \times n$  matrix **A** is represented in CSC format by the following parameters.

<b>nnz</b>	(integer)	The number of nonzero elements in the matrix.
<b>cscValA</b>	(pointer)	Points to the data array of length <b>nnz</b> that holds all nonzero values of <b>A</b> in column-major format.
<b>cscRowIndA</b>	(pointer)	Points to the integer array of length <b>nnz</b> that contains the row indices of the corresponding elements in array <b>cscValA</b> .
<b>cscColPtrA</b>	(pointer)	Points to the integer array of length <b>n+1</b> that holds indices into the arrays <b>cscRowIndA</b> and <b>cscValA</b> . The first <b>n</b> entries of this array contain the indices of the first nonzero element in the $i$ th row for $i=1, \dots, n$ , while the last entry contains <b>nnz+cscColPtrA(0)</b> . In general, <b>cscColPtrA(0)</b> is 0 or 1 for zero- and one-based indexing, respectively.

The matrix **A** in CSR format has exactly the same memory layout as its transpose in CSC format (and vice versa).

For example, consider once again the  $4 \times 5$  matrix **A**.

$$\begin{bmatrix} 1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\ 5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\ 0.0 & 0.0 & 9.0 & 0.0 & 6.0 \end{bmatrix}$$

It is stored in CSC format with zero-based indexing this way.

```
cscValA = [1.0 5.0 4.0 2.0 3.0 9.0 7.0 8.0 6.0]
cscRowIndA = [0 2 0 1 1 3 2 2 3 ]
cscColPtrA = [0 2 4 6 7 9 ]
```

In CSC format with one-based indexing, this is how it is stored.

```
cscValA = [1.0 5.0 4.0 2.0 3.0 9.0 7.0 8.0 6.0]
cscRowIndA = [1 3 1 2 2 4 3 3 4 ]
cscColPtrA = [1 3 5 7 8 10 ]
```

Each pair of row and column indices appears only once.

### 3.3.5. Ellpack-Itpack Format (ELL)

An  $\mathbf{m} \times \mathbf{n}$  sparse matrix  $\mathbf{A}$  with at most  $\mathbf{k}$  nonzero elements per row is stored in the Ellpack-Itpack (ELL) format [2] using two dense arrays of dimension  $\mathbf{m} \times \mathbf{k}$ . The first data array contains the values of the nonzero elements in the matrix, while the second integer array contains the corresponding column indices.

For example, consider the  $4 \times 5$  matrix  $\mathbf{A}$ .

$$\begin{bmatrix} 1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\ 5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\ 0.0 & 0.0 & 9.0 & 0.0 & 6.0 \end{bmatrix}$$

This is how it is stored in ELL format with zero-based indexing.

$$\begin{aligned} \text{data} &= \begin{bmatrix} 1.0 & 4.0 & 0.0 \\ 2.0 & 3.0 & 0.0 \\ 5.0 & 7.0 & 8.0 \\ 9.0 & 6.0 & 0.0 \end{bmatrix} \\ \text{indices} &= \begin{bmatrix} 0 & 1 & -1 \\ 1 & 2 & -1 \\ 0 & 3 & 4 \\ 2 & 4 & -1 \end{bmatrix} \end{aligned}$$

It is stored this way in ELL format with one-based indexing.

$$\begin{aligned} \text{data} &= \begin{bmatrix} 1.0 & 4.0 & 0.0 \\ 2.0 & 3.0 & 0.0 \\ 5.0 & 7.0 & 8.0 \\ 9.0 & 6.0 & 0.0 \end{bmatrix} \\ \text{indices} &= \begin{bmatrix} 1 & 2 & -1 \\ 2 & 3 & -1 \\ 1 & 4 & 5 \\ 3 & 5 & -1 \end{bmatrix} \end{aligned}$$

Sparse matrices in ELL format are assumed to be stored in column-major format in memory. Also, rows with less than **k** nonzero elements are padded in the **data** and **indices** arrays with zero and  $-1$ , respectively.

The ELL format is not supported directly, but it is used to store the regular part of the matrix in the HYB format that is described in the next section.

### 3.3.6. Hybrid Format (HYB)

The HYB sparse storage format is composed of a regular part, usually stored in ELL format, and an irregular part, usually stored in COO format [1]. The ELL and COO parts are always stored using zero-based indexing. HYB is implemented as an opaque data format that requires the use of a conversion operation to store a matrix in it. The conversion operation partitions the general matrix into the regular and irregular parts automatically or according to developer-specified criteria.

For more information, please refer to the description of `cusparseHybPartition_t` type, as well as the description of the conversion routines `dense2hyb`, `csc2hyb` and `csr2hyb`.

### 3.3.7. Block Compressed Sparse Row Format (BSR)

The only difference between the CSR and BSR formats is the format of the storage element. The former stores primitive data types (`single`, `double`, `cuComplex`, and `cuDoubleComplex`) whereas the latter stores a two-dimensional square block of primitive data types. The dimension of the square block is *blockDim*. The  $m \times n$  sparse matrix **A** is equivalent to a block sparse matrix  $A_b$  with  $mb = \frac{m + blockDim - 1}{blockDim}$  block rows and  $nb = \frac{n + blockDim - 1}{blockDim}$  block columns. If *m* or *n* is not multiple of *blockDim*, then zeros are filled into  $A_b$ .

**A** is represented in BSR format by the following parameters.

<b>blockDim</b>	(integer)	Block dimension of matrix <b>A</b> .
<b>mb</b>	(integer)	The number of block rows of <b>A</b> .
<b>nb</b>	(integer)	The number of block columns of <b>A</b> .
<b>nnzb</b>	(integer)	The number of nonzero blocks in the matrix.
<b>bsrValA</b>	(pointer)	Points to the data array of length $nnzb * blockDim^2$ that holds all elements of nonzero blocks of <b>A</b> . The block elements are stored in either column-major order or row-major order.
<b>bsrRowPtrA</b>	(pointer)	Points to the integer array of length $mb+1$ that holds indices into the arrays <b>bsrColIndA</b> and <b>bsrValA</b> . The first <i>mb</i> entries of this array contain the indices of the first nonzero block in the <i>i</i> th block row for $i=1, \dots, mb$ , while the last entry contains $nnzb + bsrRowPtrA(0)$ . In general, $bsrRowPtrA(0)$ is 0 or 1 for zero- and one-based indexing, respectively.
<b>bsrColIndA</b>	(pointer)	Points to the integer array of length <i>nnzb</i> that contains the column indices of the corresponding blocks in array <b>bsrValA</b> .

As with CSR format, (row, column) indices of BSR are stored in row-major order. The index arrays are first sorted by row indices and then within the same row by column indices.

For example, consider again the  $4 \times 5$  matrix  $\mathbf{A}$ .

$$\begin{bmatrix} 1.0 & 4.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 2.0 & 3.0 & 0.0 & 0.0 \\ 5.0 & 0.0 & 0.0 & 7.0 & 8.0 \\ 0.0 & 0.0 & 9.0 & 0.0 & 6.0 \end{bmatrix}$$

If *blockDim* is equal to 2, then *mb* is 2, *nb* is 3, and matrix  $\mathbf{A}$  is split into  $2 \times 3$  block matrix  $A_b$ . The dimension of  $A_b$  is  $4 \times 6$ , slightly bigger than matrix  $A$ , so zeros are filled in the last column of  $A_b$ . The element-wise view of  $A_b$  is this.

$$\begin{bmatrix} 1.0 & 4.0 & 0.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 2.0 & 3.0 & 0.0 & 0.0 & 0.0 \\ 5.0 & 0.0 & 0.0 & 7.0 & 8.0 & 0.0 \\ 0.0 & 0.0 & 9.0 & 0.0 & 6.0 & 0.0 \end{bmatrix}$$

Based on zero-based indexing, the block-wise view of  $A_b$  can be represented as follows.

$$A_b = \begin{bmatrix} A_{00} & A_{01} & A_{02} \\ A_{10} & A_{11} & A_{12} \end{bmatrix}$$

The basic element of BSR is a nonzero  $A_{ij}$  block, one that contains at least one nonzero element of  $\mathbf{A}$ . Five of six blocks are nonzero in  $A_b$ .

$$A_{00} = \begin{bmatrix} 1 & 4 \\ 0 & 2 \end{bmatrix}, A_{01} = \begin{bmatrix} 0 & 0 \\ 3 & 0 \end{bmatrix}, A_{10} = \begin{bmatrix} 5 & 0 \\ 0 & 0 \end{bmatrix}, A_{11} = \begin{bmatrix} 0 & 7 \\ 9 & 0 \end{bmatrix}, A_{12} = \begin{bmatrix} 8 & 0 \\ 6 & 0 \end{bmatrix}$$

BSR format only stores the information of nonzero blocks, including block indices (*i, j*) and values  $A_{ij}$ . Also row indices are compressed in CSR format.

$$\begin{aligned} \text{bsrValA} &= [A_{00} \ A_{01} \ A_{10} \ A_{11} \ A_{12}] \\ \text{bsrRowPtrA} &= [0 \ 2 \ 5] \\ \text{bsrColIndA} &= [0 \ 1 \ 0 \ 1 \ 2] \end{aligned}$$

There are two ways to arrange the data element of block  $A_{ij}$ : row-major order and column-major order. Under column-major order, the physical storage of **bsrValA** is this.

$$\text{bsrValA} = [1 \ 0 \ 4 \ 2 \ | \ 0 \ 3 \ 0 \ 0 \ | \ 5 \ 0 \ 0 \ 0 \ | \ 0 \ 9 \ 7 \ 0 \ | \ 8 \ 6 \ 0 \ 0 \ ]$$

Under row-major order, the physical storage of **bsrValA** is this.

$$\text{bsrValA} = [1 \ 4 \ 0 \ 2 \ | \ 0 \ 0 \ 3 \ 0 \ | \ 5 \ 0 \ 0 \ 0 \ | \ 0 \ 7 \ 9 \ 0 \ | \ 8 \ 0 \ 6 \ 0 \ ]$$

Similarly, in BSR format with one-based indexing and column-major order,  $\mathbf{A}$  can be represented by the following.

$$A_b = \begin{bmatrix} A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \end{bmatrix}$$

$$\text{bsrValA} = [1 \ 0 \ 4 \ 2 \ | \ 0 \ 3 \ 0 \ 0 \ | \ 5 \ 0 \ 0 \ 0 \ | \ 0 \ 9 \ 7 \ 0 \ | \ 8 \ 6 \ 0 \ 0 \ ]$$

```
bsrRowPtrA = [ 1   3   6]
bsrColIndA = [ 1   2   1   2   3]
```

The general BSR format has two parameters, `rowBlockDim` and `colBlockDim`. `rowBlockDim` is number of rows within a block and `colBlockDim` is number of columns within a block. If `rowBlockDim=colBlockDim`, general BSR format is the same as BSR format. If `rowBlockDim=colBlockDim=1`, general BSR format is the same as CSR format. The conversion routine `gebsr2gebsr` is used to do conversion among CSR, BSR and general BSR.

In the cuSPARSE Library, the storage format of blocks in BSR format can be column-major or row-major, independently of the base index. However, if the developer uses BSR format from the Math Kernel Library (MKL) and wants to directly interface with the cuSPARSE Library, then `cusparsedirection_t CUSPARSE_DIRECTION_COLUMN` should be used if the base index is one; otherwise, `cusparsedirection_t CUSPARSE_DIRECTION_ROW` should be used.

### 3.3.8. Extended BSR Format (BSRX)

BSRX is the same as the BSR format, but the array `bsrRowPtrA` is separated into two parts. The first nonzero block of each row is still specified by the array `bsrRowPtrA`, which is the same as in BSR, but the position next to the last nonzero block of each row is specified by the array `bsrEndPtrA`. Briefly, BSRX format is simply like a 4-vector variant of BSR format.

Matrix **A** is represented in BSRX format by the following parameters.

<b>blockDim</b>	(integer)	Block dimension of matrix <b>A</b> .
<b>mb</b>	(integer)	The number of block rows of <b>A</b> .
<b>nb</b>	(integer)	The number of block columns of <b>A</b> .
<b>nnzb</b>	(integer)	The size of <code>bsrColIndA</code> and <code>bsrValA</code> ; <code>nnzb</code> is greater than or equal to the number of nonzero blocks in the matrix <b>A</b> .
<b>bsrValA</b>	(pointer)	Points to the data array of length $nnzb * blockDim^2$ that holds all the elements of the nonzero blocks of <b>A</b> . The block elements are stored in either column-major order or row-major order.
<b>bsrRowPtrA</b>	(pointer)	Points to the integer array of length <code>mb</code> that holds indices into the arrays <code>bsrColIndA</code> and <code>bsrValA</code> ; <code>bsrRowPtr(i)</code> is the position of the first nonzero block of the <i>i</i> th block row in <code>bsrColIndA</code> and <code>bsrValA</code> .
<b>bsrEndPtrA</b>	(pointer)	Points to the integer array of length <code>mb</code> that holds indices into the arrays <code>bsrColIndA</code> and <code>bsrValA</code> ; <code>bsrEndPtr(i)</code> is the position next to the last nonzero block of the <i>i</i> th block row in <code>bsrColIndA</code> and <code>bsrValA</code> .
<b>bsrColIndA</b>	(pointer)	Points to the integer array of length <code>nnzb</code> that contains the column indices of the corresponding blocks in array <code>bsrValA</code> .

A simple conversion between BSR and BSRX can be done as follows. Suppose the developer has a  $2 \times 3$  block sparse matrix  $A_b$  represented as shown.

$$A_b = \begin{bmatrix} A_{00} & A_{01} & A_{02} \\ A_{10} & A_{11} & A_{12} \end{bmatrix}$$

Assume it has this BSR format.

$$\begin{aligned} \text{bsrValA of BSR} &= [A_{00} \ A_{01} \ A_{10} \ A_{11} \ A_{12}] \\ \text{bsrRowPtrA of BSR} &= [0 \ 2 \ 5] \\ \text{bsrColIndA of BSR} &= [0 \ 1 \ 0 \ 1 \ 2] \end{aligned}$$

The **bsrRowPtrA** of the BSRX format is simply the first two elements of the **bsrRowPtrA** BSR format. The **bsrEndPtrA** of BSRX format is the last two elements of the **bsrRowPtrA** of BSR format.

$$\begin{aligned} \text{bsrRowPtrA of BSRX} &= [0 \ 2] \\ \text{bsrEndPtrA of BSRX} &= [2 \ 5] \end{aligned}$$

The advantage of the BSRX format is that the developer can specify a submatrix in the original BSR format by modifying **bsrRowPtrA** and **bsrEndPtrA** while keeping **bsrColIndA** and **bsrValA** unchanged.

For example, to create another block matrix  $\tilde{A} = \begin{bmatrix} O & O & O \\ O & A_{11} & O \end{bmatrix}$  that is slightly different from  $A$ , the developer can keep **bsrColIndA** and **bsrValA**, but reconstruct  $\tilde{A}$  by properly setting of **bsrRowPtrA** and **bsrEndPtrA**. The following 4-vector characterizes  $\tilde{A}$ .

$$\begin{aligned} \text{bsrValA of } \tilde{A} &= [A_{00} \ A_{01} \ A_{10} \ A_{11} \ A_{12}] \\ \text{bsrColIndA of } \tilde{A} &= [0 \ 1 \ 0 \ 1 \ 2] \\ \text{bsrRowPtrA of } \tilde{A} &= [0 \ 3] \\ \text{bsrEndPtrA of } \tilde{A} &= [0 \ 4] \end{aligned}$$

# Chapter 4.

## CUSPARSE TYPES REFERENCE

### 4.1. Data types

The `float`, `double`, `cuComplex`, and `cuDoubleComplex` data types are supported. The first two are standard C data types, while the last two are exported from `cuComplex.h`.

### 4.2. `cusparseAction_t`

This type indicates whether the operation is performed only on indices or on data and indices.

Value	Meaning
<code>CUSPARSE_ACTION_SYMBOLIC</code>	the operation is performed only on indices.
<code>CUSPARSE_ACTION_NUMERIC</code>	the operation is performed on data and indices.

### 4.3. `cusparseDirection_t`

This type indicates whether the elements of a dense matrix should be parsed by rows or by columns (assuming column-major storage in memory of the dense matrix) in function `cusparse[S|D|C|Z]nnz`. Besides storage format of blocks in BSR format is also controlled by this type.

Value	Meaning
<code>CUSPARSE_DIRECTION_ROW</code>	the matrix should be parsed by rows.
<code>CUSPARSE_DIRECTION_COLUMN</code>	the matrix should be parsed by columns.

## 4.4. `cusparseHandle_t`

This is a pointer type to an opaque cuSPARSE context, which the user must initialize by calling prior to calling `cusparseCreate()` any other library function. The handle created and returned by `cusparseCreate()` must be passed to every cuSPARSE function.

## 4.5. `cusparseHybMat_t`

This is a pointer type to an opaque structure holding the matrix in HYB format, which is created by `cusparseCreateHybMat` and destroyed by `cusparseDestroyHybMat`.

### 4.5.1. `cusparseHybPartition_t`

This type indicates how to perform the partitioning of the matrix into regular (ELL) and irregular (COO) parts of the HYB format.

The partitioning is performed during the conversion of the matrix from a dense or sparse format into the HYB format and is governed by the following rules. When `CUSPARSE_HYB_PARTITION_AUTO` is selected, the cuSPARSE library automatically decides how much data to put into the regular and irregular parts of the HYB format. When `CUSPARSE_HYB_PARTITION_USER` is selected, the width of the regular part of the HYB format should be specified by the caller. When `CUSPARSE_HYB_PARTITION_MAX` is selected, the width of the regular part of the HYB format equals to the maximum number of non-zero elements per row, in other words, the entire matrix is stored in the regular part of the HYB format.

The *default* is to let the library automatically decide how to split the data.

Value	Meaning
<code>CUSPARSE_HYB_PARTITION_AUTO</code>	the automatic partitioning is selected ( <i>default</i> ).
<code>CUSPARSE_HYB_PARTITION_USER</code>	the user specified treshold is used.
<code>CUSPARSE_HYB_PARTITION_MAX</code>	the data is stored in ELL format.

## 4.6. `cusparseMatDescr_t`

This structure is used to describe the shape and properties of a matrix.

```
typedef struct {
    cusparseMatrixType_t MatrixType;
    cusparseFillMode_t FillMode;
    cusparseDiagType_t DiagType;
    cusparseIndexBase_t IndexBase;
} cusparseMatDescr_t;
```

### 4.6.1. `cusparseDiagType_t`

This type indicates if the matrix diagonal entries are unity. The diagonal elements are always assumed to be present, but if `CUSPARSE_DIAG_TYPE_UNIT` is passed to an API routine, then the routine assumes that all diagonal entries are unity and will not read or modify those entries. Note that in this case the routine assumes the diagonal entries are equal to one, regardless of what those entries are actually set to in memory.

Value	Meaning
<code>CUSPARSE_DIAG_TYPE_NON_UNIT</code>	the matrix diagonal has non-unit elements.
<code>CUSPARSE_DIAG_TYPE_UNIT</code>	the matrix diagonal has unit elements.

### 4.6.2. `cusparseFillMode_t`

This type indicates if the lower or upper part of a matrix is stored in sparse storage.

Value	Meaning
<code>CUSPARSE_FILL_MODE_LOWER</code>	the lower triangular part is stored.
<code>CUSPARSE_FILL_MODE_UPPER</code>	the upper triangular part is stored.

### 4.6.3. `cusparseIndexBase_t`

This type indicates if the base of the matrix indices is zero or one.

Value	Meaning
<code>CUSPARSE_INDEX_BASE_ZERO</code>	the base index is zero.
<code>CUSPARSE_INDEX_BASE_ONE</code>	the base index is one.

### 4.6.4. `cusparseMatrixType_t`

This type indicates the type of matrix stored in sparse storage. Notice that for symmetric, Hermitian and triangular matrices only their lower or upper part is assumed to be stored.

Value	Meaning
<code>CUSPARSE_MATRIX_TYPE_GENERAL</code>	the matrix is general.
<code>CUSPARSE_MATRIX_TYPE_SYMMETRIC</code>	the matrix is symmetric.
<code>CUSPARSE_MATRIX_TYPE_HERMITIAN</code>	the matrix is Hermitian.
<code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code>	the matrix is triangular.

## 4.7. `cusparseOperation_t`

This type indicates which operations need to be performed with the sparse matrix.

Value	Meaning
<code>CUSPARSE_OPERATION_NON_TRANSPOSE</code>	the non-transpose operation is selected.
<code>CUSPARSE_OPERATION_TRANSPOSE</code>	the transpose operation is selected.
<code>CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>	the conjugate transpose operation is selected.

## 4.8. `cusparsePointerMode_t`

This type indicates whether the scalar values are passed by reference on the host or device. It is important to point out that if several scalar values are passed by reference in the function call, all of them will conform to the same single pointer mode. The pointer mode can be set and retrieved using `cusparseSetPointerMode()` and `cusparseGetPointerMode()` routines, respectively.

Value	Meaning
<code>CUSPARSE_POINTER_MODE_HOST</code>	the scalars are passed by reference on the host.
<code>CUSPARSE_POINTER_MODE_DEVICE</code>	the scalars are passed by reference on the device.

## 4.9. `cusparseSolvePolicy_t`

This type indicates whether level information is generated and used in `csrsv2`, `csric02`, `csrilu02`, `bsrsv2`, `bsric02` and `bsrilu02`.

Value	Meaning
<code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code>	no level information is generated and used.
<code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code>	generate and use level information.

## 4.10. `cusparseSolveAnalysisInfo_t`

This is a pointer type to an opaque structure holding the information collected in the analysis phase of the solution of the sparse triangular linear system. It is expected to be passed unchanged to the solution phase of the sparse triangular linear system.

## 4.11. csrsv2Info\_t

This is a pointer type to an opaque structure holding the information used in `csrsv2_bufferSize()`, `csrsv2_analysis()`, and `csrsv2_solve()`.

## 4.12. csric02Info\_t

This is a pointer type to an opaque structure holding the information used in `csric02_bufferSize()`, `csric02_analysis()`, and `csric02()`.

## 4.13. csrilu02Info\_t

This is a pointer type to an opaque structure holding the information used in `csrilu02_bufferSize()`, `csrilu02_analysis()`, and `csrilu02()`.

## 4.14. bsrsv2Info\_t

This is a pointer type to an opaque structure holding the information used in `bsrsv2_bufferSize()`, `bsrsv2_analysis()`, and `bsrsv2_solve()`.

## 4.15. bsric02Info\_t

This is a pointer type to an opaque structure holding the information used in `bsric02_bufferSize()`, `bsric02_analysis()`, and `bsric02()`.

## 4.16. bsrilu02Info\_t

This is a pointer type to an opaque structure holding the information used in `bsrilu02_bufferSize()`, `bsrilu02_analysis()`, and `bsrilu02()`.

## 4.17. cusparseStatus\_t

This is a status type returned by the library functions and it can have the following values.

<code>CUSPARSE_STATUS_SUCCESS</code>	The operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	The cuSPARSE library was not initialized. This is usually caused by the lack of a prior call, an error in the CUDA Runtime API called by the cuSPARSE routine, or an error in the hardware setup.

	<p><b>To correct:</b> call <code>cusparseCreate()</code> prior to the function call; and check that the hardware, an appropriate version of the driver, and the cuSPARSE library are correctly installed.</p>
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	<p>Resource allocation failed inside the cuSPARSE library. This is usually caused by a <code>cudaMalloc()</code> failure.</p> <p><b>To correct:</b> prior to the function call, deallocate previously allocated memory as much as possible.</p>
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	<p>An unsupported value or parameter was passed to the function (a negative vector size, for example).</p> <p><b>To correct:</b> ensure that all the parameters being passed have valid values.</p>
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	<p>The function requires a feature absent from the device architecture; usually caused by the lack of support for atomic operations or double precision.</p> <p><b>To correct:</b> compile and run the application on a device with appropriate compute capability, which is 1.1 for 32-bit atomic operations and 1.3 for double precision.</p>
<b>CUSPARSE_STATUS_MAPPING_ERROR</b>	<p>An access to GPU memory space failed, which is usually caused by a failure to bind a texture.</p> <p><b>To correct:</b> prior to the function call, unbind any previously bound textures.</p>
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	<p>The GPU program failed to execute. This is often caused by a launch failure of the kernel on the GPU, which can be caused by multiple reasons.</p> <p><b>To correct:</b> check that the hardware, an appropriate version of the driver, and the cuSPARSE library are correctly installed.</p>
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	<p>An internal cuSPARSE operation failed. This error is usually caused by a <code>cudaMemcpyAsync()</code> failure.</p> <p><b>To correct:</b> check that the hardware, an appropriate version of the driver, and the cuSPARSE library are correctly installed. Also, check that the memory passed as a parameter to the routine is not being deallocated prior to the routine's completion.</p>
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	<p>The matrix type is not supported by this function. This is usually caused by passing an invalid matrix descriptor to the function.</p> <p><b>To correct:</b> check that the fields in <code>cusparseMatDescr_t descrA</code> were set correctly.</p>

# Chapter 5.

## CUSPARSE HELPER FUNCTION REFERENCE

The cuSPARSE helper functions are described in this section.

### 5.1. cusparseCreate()

```
cusparseStatus_t  
cusparseCreate(cusparseHandle_t *handle)
```

This function initializes the cuSPARSE library and creates a handle on the cuSPARSE context. It must be called before any other cuSPARSE API function is invoked. It allocates hardware resources necessary for accessing the GPU.

#### Output

<b>handle</b>	the pointer to the handle to the cuSPARSE context.
---------------	--

#### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the initialization succeeded.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the CUDA Runtime initialization failed.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device compute capability (CC) is less than 1.1. The CC of at least 1.1 is required.

### 5.2. cusparseCreateHybMat()

```
cusparseStatus_t  
cusparseCreateHybMat(cusparseHybMat_t *hybA)
```

This function creates and initializes the **hybA** opaque data structure.

#### Input

<b>hybA</b>	the pointer to the hybrid format storage structure.
-------------	---

#### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the structure was initialized successfully.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.

### 5.3. `cusparseCreateMatDescr()`

```
cusparseStatus_t
cusparseCreateMatDescr(cusparseMatDescr_t *descrA)
```

This function initializes the matrix descriptor. It sets the fields **MatrixType** and **IndexBase** to the *default* values `CUSPARSE_MATRIX_TYPE_GENERAL` and `CUSPARSE_INDEX_BASE_ZERO`, respectively, while leaving other fields uninitialized.

#### Input

<code>descrA</code>	the pointer to the matrix descriptor.
---------------------	---------------------------------------

#### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the descriptor was initialized successfully.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.

### 5.4. `cusparseCreateSolveAnalysisInfo()`

```
cusparseStatus_t
cusparseCreateSolveAnalysisInfo(cusparseSolveAnalysisInfo_t *info)
```

This function creates and initializes the solve and analysis structure to *default* values.

#### Input

<code>info</code>	the pointer to the solve and analysis structure.
-------------------	--

#### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the structure was initialized successfully.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.

### 5.5. `cusparseDestroy()`

```
cusparseStatus_t
cusparseDestroy(cusparseHandle_t handle)
```

This function releases CPU-side resources used by the cuSPARSE library. The release of GPU-side resources may be deferred until the application shuts down.

#### Input

<code>handle</code>	the handle to the cuSPARSE context.
---------------------	-------------------------------------

#### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the shutdown succeeded.
--------------------------------------	-------------------------

<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
--	----------------------------------

## 5.6. `cusparseDestroyHybMat()`

```
cusparseStatus_t
cusparseDestroyHybMat(cusparseHybMat_t hybA)
```

This function destroys and releases any memory required by the **hybA** structure.

### Input

<code>hybA</code>	the hybrid format storage structure.
-------------------	--------------------------------------

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the resources were released successfully.
--------------------------------------	---

## 5.7. `cusparseDestroyMatDescr()`

```
cusparseStatus_t
cusparseDestroyMatDescr(cusparseMatDescr_t descrA)
```

This function releases the memory allocated for the matrix descriptor.

### Input

<code>descrA</code>	the matrix descriptor.
---------------------	------------------------

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the resources were released successfully.
--------------------------------------	---

## 5.8. `cusparseDestroySolveAnalysisInfo()`

```
cusparseStatus_t
cusparseDestroySolveAnalysisInfo(cusparseSolveAnalysisInfo_t info)
```

This function destroys and releases any memory required by the structure.

### Input

<code>info</code>	the solve and analysis structure.
-------------------	-----------------------------------

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the resources were released successfully.
--------------------------------------	---

## 5.9. cusparseGetLevelInfo()

```
cusparseStatus_t
cusparseGetLevelInfo(cusparseHandle_t handle,
                    cusparseSolveAnalysisInfo_t info,
                    int *nlevels,
                    int **levelPtr,
                    int **levelInd)
```

This function returns the number of levels and the assignment of rows into the levels computed by either the `csrsv_analysis`, `csrsm_analysis` or `hybsv_analysis` routines.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	the pointer to the solve and analysis structure.

### Output

<b>nlevels</b>	number of levels.
<b>levelPtr</b>	integer array of <b>nlevels+1</b> elements that contains the start of every level and the end of the last level plus one.
<b>levelInd</b>	integer array of <b>m</b> (number of rows in the matrix) elements that contains the row indices belonging to every level.

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the structure was initialized successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library or the solve analysis structure was not initialized.

## 5.10. cusparseGetMatDiagType()

```
cusparseDiagType_t
cusparseGetMatDiagType(const cusparseMatDescr_t descrA)
```

This function returns the **DiagType** field of the matrix descriptor **descrA**.

### Input

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

### Returned

	One of the enumerated <code>diagType</code> types.
--	--

## 5.11. `cusparseGetMatFillMode()`

```
cusparseFillMode_t
cusparseGetMatFillMode(const cusparseMatDescr_t descrA)
```

This function returns the **FillMode** field of the matrix descriptor **descrA**.

### Input

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

### Returned

	One of the enumerated fillMode types.
--	---------------------------------------

## 5.12. `cusparseGetMatIndexBase()`

```
cusparseIndexBase_t
cusparseGetMatIndexBase(const cusparseMatDescr_t descrA)
```

This function returns the **IndexBase** field of the matrix descriptor **descrA**.

### Input

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

### Returned

	One of the enumerated indexBase types.
--	--

## 5.13. `cusparseGetMatType()`

```
cusparseMatrixType_t
cusparseGetMatType(const cusparseMatDescr_t descrA)
```

This function returns the **MatrixType** field of the matrix descriptor **descrA**.

### Input

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

### Returned

	One of the enumerated matrix types.
--	-------------------------------------

## 5.14. `cusparseGetPointerMode()`

```
cusparseStatus_t
cusparseGetPointerMode(cusparseHandle_t handle,
                       cusparsePointerMode_t *mode)
```

This function obtains the pointer mode used by the cuSPARSE library. Please see the section on the `cusparsePointerMode_t` type for more details.

#### Input

<code>handle</code>	the handle to the cuSPARSE context.
---------------------	-------------------------------------

#### Output

<code>mode</code>	One of the enumerated pointer mode types.
-------------------	---

#### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the pointer mode was returned successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.

## 5.15. `cusparseGetVersion()`

```
cusparseStatus_t
cusparseGetVersion(cusparseHandle_t handle, int *version)
```

This function returns the version number of the cuSPARSE library.

#### Input

<code>handle</code>	the handle to the cuSPARSE context.
---------------------	-------------------------------------

#### Output

<code>version</code>	the version number of the library.
----------------------	------------------------------------

#### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the version was returned successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.

## 5.16. `cusparseSetMatDiagType()`

```
cusparseStatus_t
cusparseSetMatDiagType(cusparseMatDescr_t descrA,
                       cusparseDiagType_t diagType)
```

This function sets the **DiagType** field of the matrix descriptor **descrA**.

#### Input

<code>diagType</code>	One of the enumerated diagType types.
-----------------------	---------------------------------------

#### Output

<code>descrA</code>	the matrix descriptor.
---------------------	------------------------

#### Status Returned

CUSPARSE_STATUS_SUCCESS	the field <b>DiagType</b> was set successfully.
CUSPARSE_STATUS_INVALID_VALUE	An invalid <b>diagType</b> parameter was passed.

## 5.17. cusparseSetMatFillMode()

```
cusparseStatus_t
cusparseSetMatFillMode(cusparseMatDescr_t descrA,
                       cusparseFillMode_t fillMode)
```

This function sets the **FillMode** field of the matrix descriptor **descrA**.

### Input

<b>fillMode</b>	One of the enumerated fillMode types.
-----------------	---------------------------------------

### Output

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

### Status Returned

CUSPARSE_STATUS_SUCCESS	the <b>FillMode</b> field was set successfully.
CUSPARSE_STATUS_INVALID_VALUE	An invalid <b>fillMode</b> parameter was passed.

## 5.18. cusparseSetMatIndexBase()

```
cusparseStatus_t
cusparseSetMatIndexBase(cusparseMatDescr_t descrA,
                        cusparseIndexBase_t base)
```

This function sets the **IndexBase** field of the matrix descriptor **descrA**.

### Input

<b>base</b>	One of the enumerated indexBase types.
-------------	--

### Output

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

### Status Returned

CUSPARSE_STATUS_SUCCESS	the <b>IndexBase</b> field was set successfully.
CUSPARSE_STATUS_INVALID_VALUE	An invalid <b>base</b> parameter was passed.

## 5.19. cusparseSetMatType()

```
cusparseStatus_t
cusparseSetMatType(cusparseMatDescr_t descrA, cusparseMatrixType_t type)
```

This function sets the **MatrixType** field of the matrix descriptor **descrA**.

**Input**

<b>type</b>	One of the enumerated matrix types.
-------------	-------------------------------------

**Output**

<b>descrA</b>	the matrix descriptor.
---------------	------------------------

**Status Returned**

<b>CUSPARSE_STATUS_SUCCESS</b>	the <b>MatrixType</b> field was set successfully.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	An invalid <b>type</b> parameter was passed.

## 5.20. `cusparseSetPointerMode()`

```
cusparseStatus_t
cusparseSetPointerMode(cusparseHandle_t handle,
                      cusparsePointerMode_t mode)
```

This function sets the pointer mode used by the cuSPARSE library. The *default* is for the values to be passed by reference on the host. Please see the section on the **cublasPointerMode\_t** type for more details.

**Input**

<b>handle</b>	the handle to the cuSPARSE context.
<b>mode</b>	One of the enumerated pointer mode types.

**Status Returned**

<b>CUSPARSE_STATUS_SUCCESS</b>	the pointer mode was set successfully.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	the library was not initialized.

## 5.21. `cusparseSetStream()`

```
cusparseStatus_t
cusparseSetStream(cusparseHandle_t handle, cudaStream_t streamId)
```

This function sets the stream to be used by the cuSPARSE library to execute its routines.

**Input**

<b>handle</b>	the handle to the cuSPARSE context.
<b>streamId</b>	the stream to be used by the library.

**Status Returned**

<b>CUSPARSE_STATUS_SUCCESS</b>	the stream was set successfully.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	the library was not initialized.

## 5.22. cusparseCreateCsrsv2Info()

```
cusparseStatus_t
cusparseCreateCsrsv2Info(csrsv2Info_t *info);
```

This function creates and initializes the solve and analysis structure of csrsv2 to *default* values.

### Input

<b>info</b>	the pointer to the solve and analysis structure of csrsv2.
-------------	--

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the structure was initialized successfully.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.

## 5.23. cusparseDestroyCsrsv2Info()

```
cusparseStatus_t
cusparseDestroyCsrsv2Info(csrsv2Info_t info);
```

This function destroys and releases any memory required by the structure.

### Input

<b>info</b>	the solve ( <b>csrsv2_solve</b> ) and analysis ( <b>csrsv2_analysis</b> ) structure.
-------------	--

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the resources were released successfully.
--------------------------------	---

## 5.24. cusparseCreateCsric02Info()

```
cusparseStatus_t
cusparseCreateCsric02Info(csric02Info_t *info);
```

This function creates and initializes the solve and analysis structure of incomplete Cholesky to *default* values.

### Input

<b>info</b>	the pointer to the solve and analysis structure of incomplete Cholesky.
-------------	---

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the structure was initialized successfully.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.

## 5.25. `cusparseDestroyCsrlic02Info()`

```
cusparseStatus_t
cusparseDestroyCsrlic02Info(csrlic02Info_t info);
```

This function destroys and releases any memory required by the structure.

### Input

<code>info</code>	the solve ( <code>csric02_solve</code> ) and analysis ( <code>csric02_analysis</code> ) structure.
-------------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the resources were released successfully.
--------------------------------------	---

## 5.26. `cusparseCreateCsrilu02Info()`

```
cusparseStatus_t
cusparseCreateCsrilu02Info(csrilu02Info_t *info);
```

This function creates and initializes the solve and analysis structure of incomplete LU to *default* values.

### Input

<code>info</code>	the pointer to the solve and analysis structure of incomplete LU.
-------------------	---

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the structure was initialized successfully.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.

## 5.27. `cusparseDestroyCsrilu02Info()`

```
cusparseStatus_t
cusparseDestroyCsrilu02Info(csrilu02Info_t info);
```

This function destroys and releases any memory required by the structure.

### Input

<code>info</code>	the solve ( <code>csrilu02_solve</code> ) and analysis ( <code>csrilu02_analysis</code> ) structure.
-------------------	--

**Status Returned**

CUSPARSE_STATUS_SUCCESS	the resources were released successfully.
-------------------------	---

# Chapter 6.

## CUSPARSE LEVEL 1 FUNCTION REFERENCE

This chapter describes sparse linear algebra functions that perform operations between dense and sparse vectors.

### 6.1. `cusparse<t>axpyi()`

```
cusparseStatus_t
cusparseSaxpyi(cusparseHandle_t handle, int nnz,
               const float      *alpha,
               const float      *xVal, const int *xInd,
               float            *y, cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseDaxpyi(cusparseHandle_t handle, int nnz,
               const double     *alpha,
               const double     *xVal, const int *xInd,
               double           *y, cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseCaxpyi(cusparseHandle_t handle, int nnz,
               const cuComplex  *alpha,
               const cuComplex  *xVal, const int *xInd,
               cuComplex        *y, cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseZaxpyi(cusparseHandle_t handle, int nnz,
               const cuDoubleComplex *alpha,
               const cuDoubleComplex *xVal, const int *xInd,
               cuDoubleComplex *y, cusparseIndexBase_t idxBase)
```

This function multiplies the vector **x** in sparse format by the constant  $\alpha$  and adds the result to the vector **y** in dense format. This operation can be written as

$$y = y + \alpha * x$$

In other words,

```
for i=0 to nnz-1
    y[xInd[i]-idxBase] = y[xInd[i]-idxBase] + alpha*xVal[i]
```

This function requires no extra storage. It is executed asynchronously with respect to the host, and it may return control to the application on the host before the result is ready.

#### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values of vector <b>x</b> .
<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>y</b>	<type> vector in dense format.
<b>idxBase</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.

### Output

<b>y</b>	<type> updated vector in dense format (that is unchanged if <b>nnz</b> == 0).
----------	---

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_INVALID_VALUE	the <b>idxBase</b> is neither CUSPARSE_INDEX_BASE_ZERO nor CUSPARSE_INDEX_BASE_ONE.
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.

## 6.2. `cusparse<t>doti()`

```

cusparseStatus_t
cusparseSdoti(cusparseHandle_t handle, int nnz,
              const float *xVal,
              const int *xInd, const float *y,
              float *resultDevHostPtr,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseDdoti(cusparseHandle_t handle, int nnz,
              const double *xVal,
              const int *xInd, const double *y,
              double *resultDevHostPtr,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseCdoti(cusparseHandle_t handle, int nnz,
              const cuComplex *xVal,
              const int *xInd, const cuComplex *y,
              cuComplex *resultDevHostPtr,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseZdoti(cusparseHandle_t handle, int nnz, const
              cuDoubleComplex *xVal,
              const int *xInd, const cuDoubleComplex *y,
              cuDoubleComplex *resultDevHostPtr,
              cusparseIndexBase_t idxBase)

```

This function returns the dot product of a vector **x** in sparse format and vector **y** in dense format. This operation can be written as

$$result = y^T x$$

In other words,

```
for i=0 to nnz-1
    resultDevHostPtr += xVal[i]*y[xInd[i-idxBase]]
```

This function requires some temporary extra storage that is allocated internally. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values of vector <b>x</b> .
<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>y</b>	<type> vector in dense format.
<b>resultDevHostPtr</b>	pointer to the location of the result in the device or host memory.
<b>idxBase</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.

### Output

<b>resultDevHostPtr</b>	scalar result in the device or host memory (that is zero if <b>nnz</b> == 0).
-------------------------	---

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the reduction buffer could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	the <b>idxBase</b> is neither CUSPARSE_INDEX_BASE_ZERO nor CUSPARSE_INDEX_BASE_ONE.
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.

## 6.3. `cusparse<t>dotci()`

```
cusparseStatus_t
cusparseCdotci(cusparseHandle_t handle, int nnz,
               const cuComplex      *xVal,
               const int *xInd, const cuComplex      *y,
               cuComplex      *resultDevHostPtr, cusparseIndexBase_t
               idxBase)
cusparseStatus_t
cusparseZdotci(cusparseHandle_t handle, int nnz,
               const cuDoubleComplex *xVal,
               const int *xInd, const cuDoubleComplex *y,
               cuDoubleComplex *resultDevHostPtr, cusparseIndexBase_t
               idxBase)
```

This function returns the dot product of a complex conjugate of vector **x** in sparse format and vector **y** in dense format. This operation can be written as

$$result = x^H y$$

In other words,

```
for i=0 to nnz-1
    resultDevHostPtr +=  $\overline{xVal[i]}$  * y[xInd[i-idxBase]]
```

This function requires some temporary extra storage that is allocated internally. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values of vector <b>x</b> .
<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>y</b>	<type> vector in dense format.
<b>resultDevHostPtr</b>	pointer to the location of the result in the device or host memory.
<b>idxBase</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.

### Output

<b>resultDevHostPtr</b>	scalar result in the device or host memory (that is zero if <b>nnz</b> == 0).
-------------------------	---

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the reduction buffer could not be allocated.

<code>CUSPARSE_STATUS_INVALID_VALUE</code>	the <code>idxBase</code> is neither <code>CUSPARSE_INDEX_BASE_ZERO</code> nor <code>CUSPARSE_INDEX_BASE_ONE</code> .
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 6.4. `cusparse<t>gthr()`

```

cusparseStatus_t
cusparseSgthr(cusparseHandle_t handle, int nnz,
              const float *y,
              float *xVal, const int *xInd,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseDgthr(cusparseHandle_t handle, int nnz,
              const double *y,
              double *xVal, const int *xInd,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseCgthr(cusparseHandle_t handle, int nnz,
              const cuComplex *y,
              cuComplex *xVal, const int *xInd,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseZgthr(cusparseHandle_t handle, int nnz,
              const cuDoubleComplex *y,
              cuDoubleComplex *xVal, const int *xInd,
              cusparseIndexBase_t idxBase)

```

This function gathers the elements of the vector **y** listed in the index array **xInd** into the data array **xVal**.

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>y</b>	<type> vector in dense format (of <code>size ≥ max(xInd) - idxBase + 1</code> ).
<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>idxBase</b>	<code>CUSPARSE_INDEX_BASE_ZERO</code> or <code>CUSPARSE_INDEX_BASE_ONE</code> .

### Output

<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values that were gathered from vector <b>y</b> (that is unchanged if <code>nnz == 0</code> ).
-------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	the <code>idxBase</code> is neither <code>CUSPARSE_INDEX_BASE_ZERO</code> nor <code>CUSPARSE_INDEX_BASE_ONE</code> .
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.

## 6.5. `cusparse<t>gthrz()`

```

cusparseStatus_t
cusparseSgthrz(cusparseHandle_t handle, int nnz, float          *y,
               float          *xVal, const int *xInd,
               cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseDgthrz(cusparseHandle_t handle, int nnz, double        *y,
               double        *xVal, const int *xInd,
               cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseCgthrz(cusparseHandle_t handle, int nnz, cuComplex      *y,
               cuComplex      *xVal, const int *xInd,
               cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseZgthrz(cusparseHandle_t handle, int nnz, cuDoubleComplex *y,
               cuDoubleComplex *xVal, const int *xInd,
               cusparseIndexBase_t idxBase)

```

This function gathers the elements of the vector **y** listed in the index array **xInd** into the data array **xVal**. Also, it zeros out the gathered elements in the vector **y**.

This function requires no extra storage. It is executed asynchronously with respect to the host, and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>y</b>	<type> vector in dense format (of <code>size ≥ max(xInd) - idxBase + 1</code> ).
<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>idxBase</b>	<code>CUSPARSE_INDEX_BASE_ZERO</code> or <code>CUSPARSE_INDEX_BASE_ONE</code> .

### Output

<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values that were gathered from vector <b>y</b> (that is unchanged if <code>nnz == 0</code> ).
-------------	---

<b>y</b>	<type> vector in dense format with elements indexed by <b>xInd</b> set to zero (it is unchanged if <b>nnz</b> == 0).
----------	--

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	the <b>idxBase</b> is neither <b>CUSPARSE_INDEX_BASE_ZERO</b> nor <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.

## 6.6. `cusparse<t>roti()`

```

cusparseStatus_t
cusparseSroti(cusparseHandle_t handle, int nnz, float *xVal,
              const int *xInd,
              float *y, const float *c, const float *s,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseDroti(cusparseHandle_t handle, int nnz, double *xVal,
              const int *xInd,
              double *y, const double *c, const double *s,
              cusparseIndexBase_t idxBase)

```

This function applies the Givens rotation matrix

$$G = \begin{pmatrix} c & s \\ -s & c \end{pmatrix}$$

to sparse **x** and dense **y** vectors. In other words,

```

for i=0 to nnz-1
    y[xInd[i]-idxBase] = c * y[xInd[i]-idxBase] - s*xVal[i]
    x[i]                = c * xVal[i] + s * y[xInd[i]-idxBase]

```

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values of vector <b>x</b> .
<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>y</b>	<type> vector in dense format.
<b>c</b>	cosine element of the rotation matrix.
<b>s</b>	sine element of the rotation matrix.
<b>idxBase</b>	<b>CUSPARSE_INDEX_BASE_ZERO</b> or <b>CUSPARSE_INDEX_BASE_ONE</b> .

## Output

<b>xVal</b>	<type> updated vector in sparse format (that is unchanged if <b>nnz</b> == 0).
<b>y</b>	<type> updated vector in dense format (that is unchanged if <b>nnz</b> == 0).

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	the <b>idxBase</b> is neither <b>CUSPARSE_INDEX_BASE_ZERO</b> nor <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.

## 6.7. `cusparse<t>sctr()`

```

cusparseStatus_t
cusparseSsctr(cusparseHandle_t handle, int nnz,
              const float          *xVal,
              const int *xInd, float          *y,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseDsctr(cusparseHandle_t handle, int nnz,
              const double         *xVal,
              const int *xInd, double          *y,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseCsctr(cusparseHandle_t handle, int nnz,
              const cuComplex      *xVal,
              const int *xInd, cuComplex      *y,
              cusparseIndexBase_t idxBase)
cusparseStatus_t
cusparseZsctr(cusparseHandle_t handle, int nnz,
              const cuDoubleComplex *xVal,
              const int *xInd, cuDoubleComplex *y,
              cusparseIndexBase_t idxBase)

```

This function scatters the elements of the vector **x** in sparse format into the vector **y** in dense format. It modifies only the elements of **y** whose indices are listed in the array **xInd**.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>nnz</b>	number of elements in vector <b>x</b> .
<b>xVal</b>	<type> vector with <b>nnz</b> nonzero values of vector <b>x</b> .

<b>xInd</b>	integer vector with <b>nnz</b> indices of the nonzero values of vector <b>x</b> .
<b>y</b>	<type> dense vector (of <b>size</b> $\geq \max(\mathbf{xInd}) - \mathbf{idxBase} + 1$ ).
<b>idxBase</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.

## Output

<b>y</b>	<type> vector with <b>nnz</b> nonzero values that were scattered from vector <b>x</b> (that is unchanged if <b>nnz</b> == 0).
----------	---

## Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_INVALID_VALUE	the <b>idxBase</b> is neither CUSPARSE_INDEX_BASE_ZERO nor CUSPARSE_INDEX_BASE_ONE..
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.

# Chapter 7.

## CUSPARSE LEVEL 2 FUNCTION REFERENCE

This chapter describes the sparse linear algebra functions that perform operations between sparse matrices and dense vectors.

In particular, the solution of sparse triangular linear systems is implemented in two phases. First, during the analysis phase, the sparse triangular matrix is analyzed to determine the dependencies between its elements by calling the appropriate **`csrsv_analysis()`** function. The analysis is specific to the sparsity pattern of the given matrix and to the selected **`cusparseOperation_t`** type. The information from the analysis phase is stored in the parameter of type **`cusparseSolveAnalysisInfo_t`** that has been initialized previously with a call to **`cusparseCreateSolveAnalysisInfo()`**.

Second, during the solve phase, the given sparse triangular linear system is solved using the information stored in the **`cusparseSolveAnalysisInfo_t`** parameter by calling the appropriate **`csrsv_solve()`** function. The solve phase may be performed multiple times with different right-hand sides, while the analysis phase needs to be performed only once. This is especially useful when a sparse triangular linear system must be solved for a set of different right-hand sides one at a time, while its coefficient matrix remains the same.

Finally, once all the solves have completed, the opaque data structure pointed to by the **`cusparseSolveAnalysisInfo_t`** parameter can be released by calling **`cusparseDestroySolveAnalysisInfo()`**. For more information please refer to [3].

## 7.1. `cusparse<T>bsrmv()`

```

cusparseStatus_t
cusparseSbsrmv(cusparseHandle_t handle, cusparseDirection_t dir,
               cusparseOperation_t trans, int mb, int nb, int nnzb,
               const float *alpha, const cusparseMatDescr_t descr,
               const float *bsrVal, const int *bsrRowPtr, const int *bsrColInd,
               int blockDim, const float *x,
               const float *beta, float *y)
cusparseStatus_t
cusparseDbsrmv(cusparseHandle_t handle, cusparseDirection_t dir,
               cusparseOperation_t trans, int mb, int nb, int nnzb,
               const double *alpha, const cusparseMatDescr_t descr,
               const double *bsrVal, const int *bsrRowPtr, const int *bsrColInd,
               int blockDim, const double *x,
               const double *beta, double *y)
cusparseStatus_t
cusparseCbsrmv(cusparseHandle_t handle, cusparseDirection_t dir,
               cusparseOperation_t trans, int mb, int nb, int nnzb,
               const cuComplex *alpha, const cusparseMatDescr_t descr,
               const cuComplex *bsrVal, const int *bsrRowPtr, const int *bsrColInd,
               int blockDim, const cuComplex *x,
               const cuComplex *beta, cuComplex *y)
cusparseStatus_t
cusparseZbsrmv(cusparseHandle_t handle, cusparseDirection_t dir,
               cusparseOperation_t trans, int mb, int nb, int nnzb,
               const cuDoubleComplex *alpha, const cusparseMatDescr_t descr,
               const cuDoubleComplex *bsrVal, const int *bsrRowPtr, const int
               *bsrColInd,
               int blockDim, const cuDoubleComplex *x,
               const cuDoubleComplex *beta, cuDoubleComplex *y)

```

This function performs the matrix-vector operation

$$y = \alpha * \text{op}(A) * x + \beta * y$$

where  $A$  is an  $(mb * blockDim) \times (nb * blockDim)$  sparse matrix that is defined in BSR storage format by the three arrays **bsrVal**, **bsrRowPtr**, and **bsrColInd**;  $x$  and  $y$  are vectors;  $\alpha$  and  $\beta$  are scalars; and

$$\text{op}(A) = \begin{cases} A & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ A^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ A^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

Several comments on **bsrmv()**:

- Only **CUSPARSE\_OPERATION\_NON\_TRANSPOSE** is supported, that is

$$y = \alpha * A * x + \beta * y$$

- Only **CUSPARSE\_MATRIX\_TYPE\_GENERAL** is supported.
- The size of vector  $x$  should be  $(nb * blockDim)$  at least, and the size of vector  $y$  should be  $(mb * blockDim)$  at least; otherwise, the kernel may return **CUSPARSE\_STATUS\_EXECUTION\_FAILED** because of an out-of-bounds array.

For example, suppose the user has a CSR format and wants to try **bsrmv()**, the following code demonstrates how to use **csr2bsr()** conversion and **bsrmv()** multiplication in single precision.

```
// Suppose that A is m x n sparse matrix represented by CSR format,
// hx is a host vector of size n, and hy is also a host vector of size m.
// m and n are not multiple of blockDim.
// step 1: transform CSR to BSR with column-major order
int base, nnzb;
cusparsedirection_t dirA = CUSPARSE_DIRECTION_COLUMN;
int mb = (m + blockDim-1)/blockDim;
int nb = (n + blockDim-1)/blockDim;
cudaMalloc((void**)&bsrRowPtrC, sizeof(int) * (mb+1));
cusparsExcsr2bsrNnz(handle, dirA, m, n,
    descrA, csrRowPtrA, csrColIndA, blockDim,
    descrC, bsrRowPtrC);
cudaMemcpy(&nnzb, bsrRowPtrC+mb, sizeof(int), cudaMemcpyDeviceToHost);
cudaMemcpy(&base, bsrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
nnzb -= base;
cudaMalloc((void**)&bsrColIndC, sizeof(int)*nnzb);
cudaMalloc((void**)&bsrValC, sizeof(float)*(blockDim*blockDim)*nnzb);
cusparsScsr2bsr(handle, dirA, m, n,
    descrA, csrValA, csrRowPtrA, csrColIndA, blockDim,
    descrC, bsrValC, bsrRowPtrC, bsrColIndC);
// step 2: allocate vector x and vector y large enough for bsrmv
cudaMalloc((void**)&x, sizeof(float)*(nb*blockDim));
cudaMalloc((void**)&y, sizeof(float)*(mb*blockDim));
cudaMemcpy(x, hx, sizeof(float)*n, cudaMemcpyHostToDevice);
cudaMemcpy(y, hy, sizeof(float)*m, cudaMemcpyHostToDevice);
// step 3: perform bsrmv
cusparsSbsrmv(handle, dirA, transA, mb, nb, alpha, descrC, bsrValC, bsrRowPtrC,
    bsrColIndC, blockDim, x, beta, y);
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>trans</b>	the operation $op(A)$ . Only <b>CUSPARSE_OPERATION_NON_TRANSPOSE</b> is supported.
<b>mb</b>	number of block rows of matrix <i>A</i> .
<b>nb</b>	number of block columns of matrix <i>A</i> .
<b>nnzb</b>	number of nonzero blocks of matrix <i>A</i> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descr</b>	the descriptor of matrix <i>A</i> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>bsrVal</b>	<type> array of $nnz (= csrRowPtrA(mb) - csrRowPtrA(0))$ nonzero blocks of matrix <i>A</i> .
<b>bsrRowPtr</b>	integer array of $mb + 1$ elements that contains the start of every block row and the end of the last block row plus one.

<b>bsrColInd</b>	integer array of <code>nnz</code> ( = <code>csrRowPtrA(mb) - csrRowPtrA(0)</code> ) column indices of the nonzero blocks of matrix <i>A</i> .
<b>blockDim</b>	block dimension of sparse matrix <i>A</i> , larger than zero.
<b>x</b>	<type> vector of $nb * blockDim$ elements.
<b>beta</b>	<type> scalar used for multiplication. If <b>beta</b> is zero, <b>y</b> does not have to be a valid input.
<b>y</b>	<type> vector of $mb * blockDim$ elements.

### Output

<b>y</b>	<type> updated vector.
----------	------------------------

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <code>m,n,nnz&lt;0</code> , <code>trans != CUSPARSE_OPERATION_NON_TRANSPOSE</code> , <code>blockDim&lt;1</code> , <code>dir</code> is not row-major or column-major, or <code>IndexBase</code> of <code>descr</code> is not base-0 or base-1 ).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 7.2. `cusparse<t>bsrxmv()`

```
cusparseStatus_t
cusparseSbsrxmv(cusparseHandle_t handle, cusparseDirection_t dir,
    cusparseOperation_t trans, int sizeofMask,
    int mb, int nb, int nnzb,
    const float *alpha, const cusparseMatDescr_t descr,
    const float *bsrVal, const int *bsrMaskPtr,
    const int *bsrRowPtr, const int *bsrEndPtr, const int *bsrColInd,
    int blockDim, const float *x,
    const float *beta, float *y)
cusparseStatus_t
cusparseDbsrxmv(cusparseHandle_t handle, cusparseDirection_t dir,
    cusparseOperation_t trans, int sizeofMask,
    int mb, int nb, int nnzb,
    const double *alpha, const cusparseMatDescr_t descr,
    const double *bsrVal, const int *bsrMaskPtr,
    const int *bsrRowPtr, const int *bsrEndPtr, const int *bsrColInd,
    int blockDim, const double *x,
    const double *beta, double *y)
cusparseStatus_t
cusparseCbsrxmv(cusparseHandle_t handle, cusparseDirection_t dir,
    cusparseOperation_t trans, int sizeofMask,
    int mb, int nb, int nnzb,
    const cuComplex *alpha, const cusparseMatDescr_t descr,
    const cuComplex *bsrVal, const int *bsrMaskPtr,
    const int *bsrRowPtr, const int *bsrEndPtr, const int *bsrColInd,
    int blockDim, const cuComplex *x,
    const cuComplex *beta, cuComplex *y)
cusparseStatus_t
cusparseZbsrxmv(cusparseHandle_t handle, cusparseDirection_t dir,
    cusparseOperation_t trans, int sizeofMask,
    int mb, int nb, int nnzb,
    const cuDoubleComplex *alpha, const cusparseMatDescr_t descr,
    const cuDoubleComplex *bsrVal, const int *bsrMaskPtr,
    const int *bsrRowPtr, const int *bsrEndPtr, const int *bsrColInd,
    int blockDim, const cuDoubleComplex *x,
    const cuDoubleComplex *beta, cuDoubleComplex *y)
```

This function performs a **bsrmv** and a mask operation

$$y(\text{mask}) = (\alpha * \text{op}(A) * x + \beta * y)(\text{mask})$$

where  $A$  is an  $(mb * blockDim) \times (nb * blockDim)$  sparse matrix that is defined in BSRX storage format by the four arrays **bsrVal**, **bsrRowPtr**, **bsrEndPtr**, and **bsrColInd**;  $x$  and  $y$  are vectors;  $\alpha$  and  $\beta$  are scalars; and

$$\text{op}(A) = \begin{cases} A & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ A^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ A^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

The mask operation is defined by array **bsrMaskPtr** which contains updated row indices of  $y$ . If row  $i$  is not specified in **bsrMaskPtr**, then **bsrxmv()** does not touch row block  $i$  of  $A$  and  $y[i]$ .

For example, consider the  $2 \times 3$  block matrix  $A$ :

$$A = \begin{bmatrix} A_{11} & A_{12} & O \\ A_{21} & A_{22} & A_{23} \end{bmatrix}$$

and its one-based BSR format (three vector form) is

$$\begin{aligned} \text{bsrVal} &= [A_{11} \ A_{12} \ A_{21} \ A_{22} \ A_{23}] \\ \text{bsrRowPtr} &= [1 \ 3 \ 6] \\ \text{bsrColInd} &= [1 \ 2 \ 1 \ 2 \ 3] \end{aligned}$$

Suppose we want to do the following **bsrmv** operation on a matrix  $\bar{A}$  which is slightly different from  $A$ .

$$\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} := \alpha * \left( \tilde{A} = \begin{bmatrix} O & O & O \\ O & A_{22} & O \end{bmatrix} \right) * \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} y_1 \\ \beta * y_2 \end{bmatrix}$$

We don't need to create another BSR format for the new matrix  $\bar{A}$ , all that we should do is to keep **bsrVal** and **bsrColInd** unchanged, but modify **bsrRowPtr** and add an additional array **bsrEndPtr** which points to the last nonzero elements per row of  $\bar{A}$  plus 1.

For example, the following **bsrRowPtr** and **bsrEndPtr** can represent matrix  $\bar{A}$ :

$$\begin{aligned} \text{bsrRowPtr} &= [1 \ 4] \\ \text{bsrEndPtr} &= [1 \ 5] \end{aligned}$$

Further we can use a mask operator (specified by array **bsrMaskPtr**) to update particular row indices of  $y$  only because  $y_1$  is never changed. In this case, **bsrMaskPtr** = [2]

The mask operator is equivalent to the following operation ("?" stands for don't care):

$$\begin{bmatrix} ? \\ y_2 \end{bmatrix} := \alpha * \begin{bmatrix} ? & ? & ? \\ O & A_{22} & O \end{bmatrix} * \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \beta * \begin{bmatrix} ? \\ y_2 \end{bmatrix}$$

In other words, **bsrRowPtr**[0] and **bsrEndPtr**[0] are considered "don't care".

$$\begin{aligned} \text{bsrRowPtr} &= [? \ 4] \\ \text{bsrEndPtr} &= [? \ 5] \end{aligned}$$

A couple of comments on **bsrxmv()**:

- Only **CUSPARSE\_OPERATION\_NON\_TRANSPOSE** and **CUSPARSE\_MATRIX\_TYPE\_GENERAL** are supported.
- Parameters **bsrMaskPtr**, **bsrRowPtr**, **bsrEndPtr** and **bsrColInd** are consistent with base index, either one-based or zero-based. The above example is one-based.

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .

<b>trans</b>	the operation $op(A)$ . Only <code>CUSPARSE_OPERATION_NON_TRANSPOSE</code> is supported.
<b>sizeOfMask</b>	number of updated rows of $y$ .
<b>mb</b>	number of block rows of matrix $A$ .
<b>nb</b>	number of block columns of matrix $A$ .
<b>nnzb</b>	number of nonzero blocks of matrix $A$ .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descr</b>	the descriptor of matrix $A$ . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>bsrVal</b>	<type> array of <b>nnz</b> nonzero blocks of matrix $A$ .
<b>bsrRowPtr</b>	integer array of <b>mb</b> elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrEndPtr</b>	integer array of <b>mb</b> elements that contains the end of the every block row plus one.
<b>bsrColInd</b>	integer array of <b>nnzb</b> column indices of the nonzero blocks of matrix $A$ .
<b>blockDim</b>	block dimension of sparse matrix $A$ , larger than zero.
<b>x</b>	<type> vector of $nb * blockDim$ elements.
<b>beta</b>	<type> scalar used for multiplication. If <b>beta</b> is zero, $y$ does not have to be a valid input.
<b>y</b>	<type> vector of $mb * blockDim$ elements.

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( $m, n, nnz < 0$ , <b>trans</b> != <code>CUSPARSE_OPERATION_NON_TRANSPOSE</code> , $blockDim < 1$ , <b>dir</b> is not row-major or column-major, or <b>IndexBase</b> of <b>descr</b> is not base-0 or base-1 ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.3. `cusparse<t>csrmmv()`

```

cusparseStatus_t
cusparseScsrmmv(cusparseHandle_t handle, cusparseOperation_t transA,
               int m, int n, int nnz, const float *alpha,
               const cusparseMatDescr_t descrA,
               const float *csrValA,
               const int *csrRowPtrA, const int *csrColIndA,
               const float *x, const float *y, const float *beta,
               float *y)
cusparseStatus_t
cusparseDcsrmmv(cusparseHandle_t handle, cusparseOperation_t transA,
               int m, int n, int nnz, const double *alpha,
               const cusparseMatDescr_t descrA,
               const double *csrValA,
               const int *csrRowPtrA, const int *csrColIndA,
               const double *x, const double *y, const double *beta,
               double *y)
cusparseStatus_t
cusparseCcsrmmv(cusparseHandle_t handle, cusparseOperation_t transA,
               int m, int n, int nnz, const cuComplex *alpha,
               const cusparseMatDescr_t descrA,
               const cuComplex *csrValA,
               const int *csrRowPtrA, const int *csrColIndA,
               const cuComplex *x, const cuComplex *y, const cuComplex *beta,
               cuComplex *y)
cusparseStatus_t
cusparseZcsrmmv(cusparseHandle_t handle, cusparseOperation_t transA,
               int m, int n, int nnz, const cuDoubleComplex *alpha,
               const cusparseMatDescr_t descrA,
               const cuDoubleComplex *csrValA,
               const int *csrRowPtrA, const int *csrColIndA,
               const cuDoubleComplex *x, const cuDoubleComplex *y, const cuDoubleComplex *beta,
               cuDoubleComplex *y)

```

This function performs the matrix-vector operation

$$y = \alpha * \text{op}(A) * x + \beta * y$$

**A** is an **m×n** sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **x** and **y** are vectors;  $\alpha$  and  $\beta$  are scalars; and

$$\text{op}(A) = \begin{cases} A & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ A^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ A^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

When using the (conjugate) transpose of a general matrix or a Hermitian/symmetric matrix, this routine may produce slightly different results during different runs with the same input parameters. For these matrix types it uses atomic operations to compute the final result, consequently many threads may be adding floating point numbers to the same memory location without any specific ordering, which may produce slightly different results for each run.

If exactly the same output is required for any input when multiplying by the transpose of a general matrix, the following procedure can be used:

1. Convert the matrix from CSR to CSC format using one of the **csr2csc()** functions. Notice that by interchanging the rows and columns of the result you are implicitly transposing the matrix.
2. Call the **csrmmv()** function with the **cusparseOperation\_t** parameter set to **CUSPARSE\_OPERATION\_NON\_TRANSPOSE** and with the interchanged rows and columns of the matrix stored in CSC format. This (implicitly) multiplies the vector by the transpose of the matrix in the original CSR format.

This function requires no extra storage for the general matrices when operation **CUSPARSE\_OPERATION\_NON\_TRANSPOSE** is selected. It requires some extra storage for Hermitian/symmetric matrices and for the general matrices when an operation different than **CUSPARSE\_OPERATION\_NON\_TRANSPOSE** is selected. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>trans</b>	the operation $\text{op}(A)$ .
<b>m</b>	number of rows of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzero elements of matrix <b>A</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , <b>CUSPARSE_MATRIX_TYPE_SYMMETRIC</b> , and <b>CUSPARSE_MATRIX_TYPE_HERMITIAN</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m+1</b> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) column indices of the nonzero elements of matrix <b>A</b> .
<b>x</b>	<type> vector of <b>n</b> elements if $\text{op}(A) = A$ , and <b>m</b> elements if $\text{op}(A) = A^T$ or $\text{op}(A) = A^H$
<b>beta</b>	<type> scalar used for multiplication. If <b>beta</b> is zero, <b>y</b> does not have to be a valid input.
<b>y</b>	<type> vector of <b>m</b> elements if $\text{op}(A) = A$ , and <b>n</b> elements if $\text{op}(A) = A^T$ or $\text{op}(A) = A^H$

### Output

<b>y</b>	<type> updated vector.
----------	------------------------

**Status Returned**

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( $m, n, nnz < 0$ ).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision (compute capability (c.c.) $\geq 1.3$ required), symmetric/Hermitian matrix (c.c. $\geq 1.2$ required), or transpose operation (c.c. $\geq 1.1$ required).
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 7.4. `cusparse<t>bsrsv2_bufferSize()`

```

cusparseStatus_t
cusparseSbsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           cusparseOperation_t transA,

                            int nnzb,
                            const cusparseMatDescr_t descrA,
                            double *bsrValA,
                            const int *bsrRowPtrA,
                            const int *bsrColIndA,
                            int blockDim,
                            bsrsv2Info_t info,
                            int *pBufferSize);

cusparseStatus_t
cusparseCbsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           cusparseOperation_t transA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           cuComplex *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsrsv2Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseZbsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           cusparseOperation_t transA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           cuDoubleComplex *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsrsv2Info_t info,
                           int *pBufferSize);

```

This function returns size of the buffer used in **bsrsv2**, a new sparse triangular linear system  $\text{op}(\mathbf{A}) * \mathbf{y} = \alpha \mathbf{x}$ .

**A** is an  $(\text{mb} * \text{blockDim}) \times (\text{mb} * \text{blockDim})$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**; **x** and **y** are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ \mathbf{A}^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ \mathbf{A}^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

Although there are six combinations in terms of parameter **trans** and the upper (lower) triangular part of **A**, **bsrsv2\_bufferSize()** returns the maximum size buffer among these combinations. The buffer size depends on the dimensions **mb**, **blockDim**, and the number of nonzero blocks of the matrix **nnzb**. If the user changes the matrix, it is necessary to call **bsrsv2\_bufferSize()** again to have the correct buffer size; otherwise a segmentation fault may occur.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>transA</b>	the operation $\text{op}(\mathbf{A})$ .
<b>mb</b>	number of block rows of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , while the supported diagonal types are <b>CUSPARSE_DIAG_TYPE_UNIT</b> and <b>CUSPARSE_DIAG_TYPE_NON_UNIT</b> .
<b>bsrValA</b>	<type> array of <b>nnzb</b> ( $= \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0)$ ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <b>mb</b> + 1 elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <b>nnzb</b> ( $= \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0)$ ) column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> ; must be larger than zero.

### Output

<b>info</b>	record of internal states based on different algorithms.
<b>pBufferSize</b>	number of bytes of the buffer used in the <b>bsrsv2_analysis()</b> and <b>bsrsv2_solve()</b> .

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb</code> , <code>nnzb</code> $\leq 0$ ), base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.5. cusparse<t>bsrsv2\_analysis()

```
cusparseStatus_t
cusparseSbsrsv2_analysis(cusparseHandle_t handle,
                        cusparseDirection_t dirA,
                        cusparseOperation_t transA,

                        int blockDim,
                        bsrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);
```

```
cusparseStatus_t
cusparseCbsrsv2_analysis(cusparseHandle_t handle,
                        cusparseDirection_t dirA,
                        cusparseOperation_t transA,
                        int mb,
                        int nnzb,
                        const cusparseMatDescr_t descrA,
                        const cuComplex *bsrValA,
                        const int *bsrRowPtrA,
                        const int *bsrColIndA,
                        int blockDim,
                        bsrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);
```

```
cusparseStatus_t
cusparseZbsrsv2_analysis(cusparseHandle_t handle,
                        cusparseDirection_t dirA,
                        cusparseOperation_t transA,
                        int mb,
                        int nnzb,
                        const cusparseMatDescr_t descrA,
                        const cuDoubleComplex *bsrValA,
                        const int *bsrRowPtrA,
                        const int *bsrColIndA,
                        int blockDim,
                        bsrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);
```

This function performs the analysis phase of **bsrsv2**, a new sparse triangular linear system  $\text{op}(\mathbf{A}) * \mathbf{y} = \alpha \mathbf{x}$ .

**A** is an  $(\text{mb} * \text{blockDim}) \times (\text{mb} * \text{blockDim})$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**; **x** and **y** are the right-hand side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ \mathbf{A}^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ \mathbf{A}^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

The block of BSR format is of size **blockDim\*blockDim**, stored as column-major or row-major as determined by parameter **dirA**, which is either **CUSPARSE\_DIRECTION\_COLUMN** or **CUSPARSE\_DIRECTION\_ROW**. The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**, and the fill mode and diagonal type are ignored.

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a buffer size returned by **bsrsv2\_bufferSize()**. The address of **pBuffer** must be multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **bsrsv2\_analysis()** reports a structural zero and computes level information, which stored in the opaque structure **info**. The level information can extract more parallelism for a triangular solver. However **bsrsv2\_solve()** can be done without level information. To disable level information, the user needs to specify the policy of the triangular solver as **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**.

Function **bsrsv2\_analysis()** always reports the first structural zero, even when parameter **policy** is **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**. No structural zero is reported if **CUSPARSE\_DIAG\_TYPE\_UNIT** is specified, even if block **A(j, j)** is missing for some **j**. The user needs to call **cusparseXbsrsv2\_zeroPivot()** to know where the structural zero is.

It is the user's choice whether to call **bsrsv2\_solve()** if **bsrsv2\_analysis()** reports a structural zero. In this case, the user can still call **bsrsv2\_solve()**, which will return a numerical zero at the same position as a structural zero. However the result **x** is meaningless.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>transA</b>	the operation $\text{op}(\mathbf{A})$ .
<b>mb</b>	number of block rows of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , while the supported diagonal types

	are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<code>bsrValA</code>	<type> array of <code>nnzb</code> ( $= \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0)$ ) nonzero blocks of matrix <b>A</b> .
<code>bsrRowPtrA</code>	integer array of <code>mb + 1</code> elements that contains the start of every block row and the end of the last block row plus one.
<code>bsrColIndA</code>	integer array of <code>nnzb</code> ( $= \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0)$ ) column indices of the nonzero blocks of matrix <b>A</b> .
<code>blockDim</code>	block dimension of sparse matrix <b>A</b> , larger than zero.
<code>info</code>	structure initialized using <code>cusparseCreateBsrsv2Info()</code> .
<code>policy</code>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<code>pBuffer</code>	buffer allocated by the user, the size is return by <code>bsrsv2_bufferSize()</code> .

## Output

<code>info</code>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nnzb &lt;= 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.6. `cusparse<t>bsrsv2_solve()`

This function performs the solve phase of **bsrsv2**, a new sparse triangular linear system  $\text{op}(\mathbf{A}) * \mathbf{y} = \alpha \mathbf{x}$ .

**A** is an  $(\text{mb} * \text{blockDim}) \times (\text{mb} * \text{blockDim})$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**; **x** and **y** are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ \mathbf{A}^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ \mathbf{A}^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

The block in BSR format is of size **blockDim\*blockDim**, stored as column-major or row-major as determined by parameter **dirA**, which is either **CUSPARSE\_DIRECTION\_COLUMN** or **CUSPARSE\_DIRECTION\_ROW**. The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**, and the fill mode and diagonal type are ignored. Function **bsrsv02\_solve()** can support an arbitrary **blockDim**.

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires a buffer size returned by **bsrsv2\_bufferSize()**. The address of **pBuffer** must be multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Although **bsrsv2\_solve()** can be done without level information, the user still needs to be aware of consistency. If **bsrsv2\_analysis()** is called with policy **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**, **bsrsv2\_solve()** can be run with or without levels. On the other hand, if **bsrsv2\_analysis()** is called with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**, **bsrsv2\_solve()** can only accept **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**; otherwise, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

The level information may not improve the performance, but may spend extra time doing analysis. For example, a tridiagonal matrix has no parallelism. In this case, **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL** performs better than **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**. If the user has an iterative solver, the best approach is to do **bsrsv2\_analysis()** with **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL** once. Then do **bsrsv2\_solve()** with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL** in the first run, and with **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL** in the second run, and pick the fastest one to perform the remaining iterations.

Function **bsrsv02\_solve()** has the same behavior as **csrsv02\_solve()**. That is, **bsr2csr(bsrsv02(A)) = csrsv02(bsr2csr(A))**. The numerical zero of **csrsv02\_solve()** means there exists some zero **A(j, j)**. The numerical zero of **bsrsv02\_solve()** means there exists some block **A(j, j)** that is not invertible.

Function **bsrsv2\_solve()** reports the first numerical zero, including a structural zero. No numerical zero is reported if **CUSPARSE\_DIAG\_TYPE\_UNIT** is specified, even if **A(j, j)** is not invertible for some **j**. The user needs to call **cusparseXbsrsv2\_zeroPivot()** to know where the numerical zero is.

For example, suppose  $L$  is a lower triangular matrix with unit diagonal, then the following code solves  $L\mathbf{y}=\mathbf{x}$  by level information.

```
// Suppose that L is m x m sparse matrix represented by BSR format,
// The number of block rows/columns is mb, and
// the number of nonzero blocks is nnzb.
// L is lower triangular with unit diagonal.
// Assumption:
// - dimension of matrix L is m(=mb*blockDim),
// - matrix L has nnz(=nnzb*blockDim*blockDim) nonzero elements,
// - handle is already created by cusparseCreate(),
// - (d_bsrRowPtr, d_bsrColInd, d_bsrVal) is BSR of L on device memory,
// - d_x is right hand side vector on device memory.
// - d_y is solution vector on device memory.
// - d_x and d_y are of size m.
cusparseMatDescr_t descr = 0;
bsrsv2Info_t info = 0;
int pBufferSize;
char *pBuffer = 0;
int structural_zero;
int numerical_zero;
const double alpha = 1.;
const cusparseSolvePolicy_t policy = CUSPARSE_SOLVE_POLICY_USE_LEVEL;
const cusparseOperation_t trans = CUSPARSE_OPERATION_NON_TRANSPOSE;
const cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;

// step 1: create a descriptor which contains
// - matrix L is base-1
// - matrix L is lower triangular
// - matrix L has unit diagonal, specified by parameter CUSPARSE_DIAG_TYPE_UNIT
// (L may not have all diagonal elements.)
cusparseCreateMatDescr(&descr);
cusparseSetMatIndexBase(descr, CUSPARSE_INDEX_BASE_ONE);
cusparseSetMatFillMode(descr, CUSPARSE_FILL_MODE_LOWER);
cusparseSetMatDiagType(descr, CUSPARSE_DIAG_TYPE_UNIT);

// step 2: create a empty info structure
cusparseCreateBsrsv2Info(&info);

// step 3: query how much memory used in bsrsv2, and allocate the buffer
cusparseDbbsrv2_bufferSize(handle, dir, trans, mb, nnzb, descr,
    d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, &pBufferSize);

// pBuffer returned by cudaMalloc is automatically aligned to 128 bytes.
cudaMalloc((void**)&pBuffer, pBufferSize);

// step 4: perform analysis
cusparseDbbsrv2_analysis(handle, dir, trans, mb, nnzb, descr,
    d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim,
    info, policy, pBuffer);
// L has unit diagonal, so no structural zero is reported.
status = cusparseXbsrv2_zeroPivot(handle, info, &structural_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is missing\n", structural_zero, structural_zero);
}

// step 5: solve L*y = x
cusparseDbbsrv2_solve(handle, dir, trans, mb, nnzb, &alpha, descr,
    d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, info,
    d_x, d_y, policy, pBuffer);
// L has unit diagonal, so no numerical zero is reported.
status = cusparseXbsrv2_zeroPivot(handle, info, &numerical_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is zero\n", numerical_zero, numerical_zero);
}

// step 6: free resources
cudaFree(pBuffer);
cusparseDestroyBsrsv2Info(info);
cusparseDestroyMatDescr(descr);
cusparseDestroy(handle);
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>transA</b>	the operation $\text{op}(A)$ .
<b>mb</b>	number of block rows and block columns of matrix <b>A</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> , while the supported diagonal types are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<b>bsrValA</b>	<type> array of <code>nnzb (= bsrRowPtrA(mb) - bsrRowPtrA(0) )</code> nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <code>mb + 1</code> elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <code>nnzb (= bsrRowPtrA(mb) - bsrRowPtrA(0) )</code> column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> , larger than zero.
<b>info</b>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<b>x</b>	<type> right-hand-side vector of size <code>m</code> .
<b>policy</b>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<b>pBuffer</b>	buffer allocated by the user, the size is returned by <code>bsrsrv2_bufferSize()</code> .

## Output

<b>y</b>	<type> solution vector of size <code>m</code> .
----------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nnzb &lt;= 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_MAPPING_ERROR</code>	the texture binding failed.

<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.7. `cusparseXbsrsv2_zeroPivot()`

```
cusparseStatus_t
cusparseXbsrsv2_zeroPivot(cusparseHandle_t handle,
                          bsrsv2Info_t info,
                          int *position);
```

If the returned error code is `CUSPARSE_STATUS_ZERO_PIVOT`, **position=j** means **A(j,j)** is either structural zero or numerical zero (singular block). Otherwise **position=-1**.

The **position** can be 0-based or 1-based, the same as the matrix.

Function `cusparseXbsrsv2_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.

The **position** can be in the host memory or device memory. The user can set the proper mode with `cusparseSetPointerMode()`.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	<b>info</b> contains a structural zero or numerical zero if the user already called <code>bsrsv2_analysis()</code> or <code>bsrsv2_solve()</code> .

### Output

<b>position</b>	if no structural or numerical zero, <b>position</b> is -1; otherwise if <b>A(j,j)</b> is missing or <b>U(j,j)</b> is zero, <b>position=j</b> .
-----------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	<b>info</b> is not valid.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 7.8. `cusparse<t>csrsv_analysis()`

```

cusparseStatus_t
cusparseScsrsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz, const cusparseMatDescr_t descrA,
                        const float *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseDcsrsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz, const cusparseMatDescr_t descrA,
                        const double *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseCcsrsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz, const cusparseMatDescr_t descrA,
                        const cuComplex *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseZcsrsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz, const cusparseMatDescr_t descrA,
                        const cuDoubleComplex *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

```

This function performs the analysis phase of the solution of a sparse triangular linear system

$$\text{op}(\mathbf{A}) * \mathbf{y} = \alpha * \mathbf{x}$$

where  $\mathbf{A}$  is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**;  $\mathbf{x}$  and  $\mathbf{y}$  are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ \mathbf{A}^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ \mathbf{A}^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a significant amount of extra storage that is proportional to the matrix size. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>trans</b>	the operation $\text{op}(\mathbf{A})$
<b>m</b>	number of rows of matrix $\mathbf{A}$ .

<b>nnz</b>	number of nonzero elements of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix types are <code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> and <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> , while the supported diagonal types are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<b>csrValA</b>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure initialized using <code>cusparseCreateSolveAnalysisInfo</code> .

## Output

<b>info</b>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.9. `cusparse<t>csrsv_solve()`

```

cusparseStatus_t
cusparseScsrsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    int m, const float      *alpha,
                    const cusparseMatDescr_t descrA,
                    const float      *csrValA,
                    const int *csrRowPtrA, const int *csrColIndA,
                    cusparseSolveAnalysisInfo_t info,
                    const float      *x, float      *y)

cusparseStatus_t
cusparseDcsrsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    int m, const double     *alpha,
                    const cusparseMatDescr_t descrA,
                    const double     *csrValA,
                    const int *csrRowPtrA, const int *csrColIndA,
                    cusparseSolveAnalysisInfo_t info,
                    const double     *x, double     *y)

cusparseStatus_t
cusparseCcsrsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    int m, const cuComplex  *alpha,
                    const cusparseMatDescr_t descrA,
                    const cuComplex  *csrValA,
                    const int *csrRowPtrA, const int *csrColIndA,
                    cusparseSolveAnalysisInfo_t info,
                    const cuComplex  *x, cuComplex *y)

cusparseStatus_t
cusparseZcsrsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    int m, const cuDoubleComplex *alpha,
                    const cusparseMatDescr_t descrA,
                    const cuDoubleComplex *csrValA,
                    const int *csrRowPtrA, const int *csrColIndA,
                    cusparseSolveAnalysisInfo_t info,
                    const cuDoubleComplex *x, cuDoubleComplex *y)

```

This function performs the solve phase of the solution of a sparse triangular linear system

$$\text{op}(\mathbf{A}) * \mathbf{y} = \alpha * \mathbf{x}$$

where  $\mathbf{A}$  is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**;  $\mathbf{x}$  and  $\mathbf{y}$  are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ \mathbf{A}^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ \mathbf{A}^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

## Input

<code>handle</code>	handle to the cuSPARSE library context.
<code>trans</code>	the operation $\text{op}(A)$
<code>m</code>	number of rows and columns of matrix <b>A</b> .
<code>alpha</code>	<type> scalar used for multiplication.
<code>descrA</code>	the descriptor of matrix <b>A</b> . The supported matrix types are <code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> and <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> , while the supported diagonal types are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<code>csrValA</code>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<code>csrRowPtrA</code>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<code>csrColIndA</code>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<code>info</code>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<code>x</code>	<type> right-hand-side vector of size <code>m</code> .

## Output

<code>y</code>	<type> solution vector of size <code>m</code> .
----------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_MAPPING_ERROR</code>	the texture binding failed.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.10. `cusparse<t>csrsv2_bufferSize()`

```

cusparseStatus_t
cusparseScsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseOperation_t transA,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           float *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrsv2Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseDcsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseOperation_t transA,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           double *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrsv2Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseCcsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseOperation_t transA,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           cuComplex *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrsv2Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseZcsrsv2_bufferSize(cusparseHandle_t handle,
                           cusparseOperation_t transA,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           cuDoubleComplex *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrsv2Info_t info,
                           int *pBufferSize);

```

This function returns the size of the buffer used in **csrsv2**, a new sparse triangular linear system  $\mathbf{op}(\mathbf{A}) * \mathbf{y} = \alpha \mathbf{x}$ .

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **x** and **y** are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ \mathbf{A}^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ \mathbf{A}^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

Although there are six combinations in terms of the parameter **trans** and the upper (lower) triangular part of **A**, **csrsv2\_bufferSize()** returns the maximum size buffer of these combinations. The buffer size depends on the dimension and the number of nonzero elements of the matrix. If the user changes the matrix, it is necessary to call **csrsv2\_bufferSize()** again to have the correct buffer size; otherwise, a segmentation fault may occur.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $\text{op}(\mathbf{A})$ .
<b>m</b>	number of rows of matrix <b>A</b> .
<b>nnz</b>	number of nonzero elements of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , while the supported diagonal types are <b>CUSPARSE_DIAG_TYPE_UNIT</b> and <b>CUSPARSE_DIAG_TYPE_NON_UNIT</b> .
<b>csrValA</b>	<type> array of $\text{nnz} (= \text{csrRowPtrA}(\text{m}) - \text{csrRowPtrA}(0))$ nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of $\text{m} + 1$ elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of $\text{nnz} (= \text{csrRowPtrA}(\text{m}) - \text{csrRowPtrA}(0))$ column indices of the nonzero elements of matrix <b>A</b> .

### Output

<b>info</b>	record of internal states based on different algorithms.
<b>pBufferSize</b>	number of bytes of the buffer used in the <b>csrsv2_analysis</b> and <b>csrsv2_solve</b> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( $\text{m}, \text{nnz} \leq 0$ ), base index is not 0 or 1.
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device only supports compute capability 2.0 and above.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 7.11. `cusparse<t>csrsv2_analysis()`

```

cusparseStatus_t
cusparseScsrsv2_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m,
                        int nnz,
                        const cusparseMatDescr_t descrA,
                        const float *csrValA,
                        const int *csrRowPtrA,
                        const int *csrColIndA,
                        csrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);

cusparseStatus_t
cusparseDcsrsv2_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m,

                        const int *csrRowPtrA,
                        const int *csrColIndA,
                        csrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);

cusparseStatus_t
cusparseCcsrsv2_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m,
                        int nnz,
                        const cusparseMatDescr_t descrA,
                        const cuComplex *csrValA,
                        const int *csrRowPtrA,
                        const int *csrColIndA,
                        csrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);

cusparseStatus_t
cusparseZcsrsv2_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m,
                        int nnz,
                        const cusparseMatDescr_t descrA,
                        const cuDoubleComplex *csrValA,
                        const int *csrRowPtrA,
                        const int *csrColIndA,
                        csrsv2Info_t info,
                        cusparseSolvePolicy_t policy,
                        char *pBuffer);

```

This function performs the analysis phase of **csrsv2**, a new sparse triangular linear system  $\mathbf{op(A)} * \mathbf{y} = \alpha \mathbf{x}$ .

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **x** and **y** are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(A) = \begin{cases} A & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ A^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ A^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a buffer size returned by **csrsv2\_bufferSize()**. The address of **pBuffer** must be multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **csrsv2\_analysis()** reports a structural zero and computes level information that is stored in opaque structure **info**. The level information can extract more parallelism for a triangular solver. However **csrsv2\_solve()** can be done without level information. To disable level information, the user needs to specify the policy of the triangular solver as **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**.

Function **csrsv2\_analysis()** always reports the first structural zero, even if the policy is **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**. No structural zero is reported if **CUSPARSE\_DIAG\_TYPE\_UNIT** is specified, even if **A(j, j)** is missing for some **j**. The user needs to call **cusparseXcsrsv2\_zeroPivot()** to know where the structural zero is.

It is the user's choice whether to call **csrsv2\_solve()** if **csrsv2\_analysis()** reports a structural zero. In this case, the user can still call **csrsv2\_solve()** which will return a numerical zero in the same position as the structural zero. However the result **x** is meaningless.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation <b>op(A)</b> .
<b>m</b>	number of rows of matrix <b>A</b> .
<b>nnz</b>	number of nonzero elements of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , while the supported diagonal types are <b>CUSPARSE_DIAG_TYPE_UNIT</b> and <b>CUSPARSE_DIAG_TYPE_NON_UNIT</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of $m + 1$ elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) column indices of the nonzero elements of matrix <b>A</b> .

<code>info</code>	structure initialized using <code>cusparseCreateCsrsv2Info()</code> .
<code>policy</code>	The supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<code>pBuffer</code>	buffer allocated by the user, the size is returned by <code>csrsv2_bufferSize()</code> .

## Output

<code>info</code>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt;= 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.12. `cusparse<t>csrsv2_solve()`

```
cusparseStatus_t
cusparseScsrsv2_solve(cusparseHandle_t handle,
                      cusparseOperation_t transA,
                      int m,
                      int nnz,
                      const float *alpha,
                      const cusparseMatDescr_t descra,
                      const float *csrValA,
                      const int *csrRowPtrA,
                      const int *csrColIndA,
                      csrsv2Info_t info,
                      const float *x,
                      float *y,
                      cusparseSolvePolicy_t policy,
                      char *pBuffer);
```

```
cusparseStatus_t
cusparseDcsrsv2_solve(cusparseHandle_t handle,
                      cusparseOperation_t transA,
                      int m,
                      int nnz,
                      const double *alpha,

                      cusparseSolvePolicy_t policy,
                      char *pBuffer);
```

```
cusparseStatus_t
cusparseCcsrsv2_solve(cusparseHandle_t handle,
                      cusparseOperation_t transA,
                      int m,
                      int nnz,
                      const cuComplex *alpha,
                      const cusparseMatDescr_t descra,
                      const cuComplex *csrValA,
                      const int *csrRowPtrA,
                      const int *csrColIndA,
                      csrsv2Info_t info,
                      const cuComplex *x,
                      cuComplex *y,
                      cusparseSolvePolicy_t policy,
                      char *pBuffer);
```

```
cusparseStatus_t
cusparseZcsrsv2_solve(cusparseHandle_t handle,
                      cusparseOperation_t transA,
                      int m,
                      int nnz,
                      const cuDoubleComplex *alpha,
                      const cusparseMatDescr_t descra,
                      const cuDoubleComplex *csrValA,
                      const int *csrRowPtrA,
                      const int *csrColIndA,
                      csrsv2Info_t info,
                      const cuDoubleComplex *x,
                      cuDoubleComplex *y,
                      cusparseSolvePolicy_t policy,
                      char *pBuffer);
```

This function performs the solve phase of **csrsv2**, a new sparse triangular linear system  $\text{op}(\mathbf{A}) * \mathbf{y} = \alpha \mathbf{x}$ .

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **x** and **y** are the right-hand-side and the solution vectors;  $\alpha$  is a scalar; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ \mathbf{A}^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ \mathbf{A}^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires the buffer size returned by **csrsv2\_bufferSize()**. The address of **pBuffer** must be multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Although **csrsv2\_solve()** can be done without level information, the user still needs to be aware of consistency. If **csrsv2\_analysis()** is called with policy **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**, **csrsv2\_solve()** can be run with or without levels. On the contrary, if **csrsv2\_analysis()** is called with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**, **csrsv2\_solve()** can only accept **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**; otherwise, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

The level information may not improve the performance but spend extra time doing analysis. For example, a tridiagonal matrix has no parallelism. In this case, **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL** performs better than **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**. If the user has an iterative solver, the best approach is to do **csrsv2\_analysis()** with **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL** once. Then do **csrsv2\_solve()** with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL** in the first run and with **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL** in the second run, picking faster one to perform the remaining iterations.

Function **csrsv2\_solve()** reports the first numerical zero, including a structural zero. If **status** is 0, no numerical zero was found. Furthermore, no numerical zero is reported if **CUSPARSE\_DIAG\_TYPE\_UNIT** is specified, even if **A(j, j)** is zero for some **j**. The user needs to call **cusparseXcsrsv2\_zeroPivot()** to know where the numerical zero is.

For example, suppose  $L$  is a lower triangular matrix with unit diagonal, the following code solves  $L\mathbf{y}=\mathbf{x}$  by level information.

```
// Suppose that L is m x m sparse matrix represented by CSR format,
// L is lower triangular with unit diagonal.
// Assumption:
// - dimension of matrix L is m,
// - matrix L has nnz number zero elements,
// - handle is already created by cusparseCreate(),
// - (d_csrRowPtr, d_csrColInd, d_csrVal) is CSR of L on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory.

cusparseMatDescr_t descr = 0;
csrsv2Info_t info = 0;
int pBufferSize;
char *pBuffer = 0;
int structural_zero;
int numerical_zero;
const double alpha = 1.;
const cusparseSolvePolicy_t policy = CUSPARSE_SOLVE_POLICY_USE_LEVEL;
const cusparseOperation_t trans = CUSPARSE_OPERATION_NON_TRANSPOSE;

// step 1: create a descriptor which contains
// - matrix L is base-1
// - matrix L is lower triangular
// - matrix L has unit diagonal, specified by parameter CUSPARSE_DIAG_TYPE_UNIT
// (L may not have all diagonal elements.)
cusparseCreateMatDescr(&descr);
cusparseSetMatIndexBase(descr, CUSPARSE_INDEX_BASE_ONE);
cusparseSetMatFillMode(descr, CUSPARSE_FILL_MODE_LOWER);
cusparseSetMatDiagType(descr, CUSPARSE_DIAG_TYPE_UNIT);

// step 2: create a empty info structure
cusparseCreateCsrsv2Info(&info);

// step 3: query how much memory used in csrsv2, and allocate the buffer
cusparseDcsrsv2_bufferSize(handle, trans, m, nnz, descr,
    d_csrVal, d_csrRowPtr, d_csrColInd, &pBufferSize);
// pBuffer returned by cudaMalloc is automatically aligned to 128 bytes.
cudaMalloc((void**)&pBuffer, pBufferSize);

// step 4: perform analysis
cusparseDcsrsv2_analysis(handle, trans, m, nnz, descr,
    d_csrVal, d_csrRowPtr, d_csrColInd,
    info, policy, pBuffer);
// L has unit diagonal, so no structural zero is reported.
status = cusparseXcsrsv2_zeroPivot(handle, info, &structural_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is missing\n", structural_zero, structural_zero);
}

// step 5: solve L*y = x
cusparseDcsrsv2_solve(handle, trans, m, nnz, &alpha, descr,
    d_csrVal, d_csrRowPtr, d_csrColInd, info,
    d_x, d_y, policy, pBuffer);
// L has unit diagonal, so no numerical zero is reported.
status = cusparseXcsrsv2_zeroPivot(handle, info, &numerical_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status){
    printf("L(%d,%d) is zero\n", numerical_zero, numerical_zero);
}

// step 6: free resources
cudaFree(pBuffer);
cusparseDestroyCsrsv2Info(info);
cusparseDestroyMatDescr(descr);
cusparseDestroy(handle);
```

## Input

<code>handle</code>	handle to the cuSPARSE library context.
<code>transA</code>	the operation $\text{op}(A)$ .
<code>m</code>	number of rows and columns of matrix <b>A</b> .
<code>alpha</code>	<type> scalar used for multiplication.
<code>descrA</code>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> , while the supported diagonal types are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<code>csrValA</code>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<code>csrRowPtrA</code>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<code>csrColIndA</code>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<code>info</code>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<code>x</code>	<type> right-hand-side vector of size <code>m</code> .
<code>policy</code>	The supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<code>pBuffer</code>	buffer allocated by the user, the size is return by <code>csrsv2_bufferSize</code> .

## Output

<code>y</code>	<type> solution vector of size <code>m</code> .
----------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt;= 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_MAPPING_ERROR</code>	the texture binding failed.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.13. `cusparseXcsrsv2_zeroPivot()`

```
cusparseStatus_t
cusparseXcsrsv2_zeroPivot(cusparseHandle_t handle,
                          csrsv2Info_t info,
                          int *position);
```

If the returned error code is **CUSPARSE\_STATUS\_ZERO\_PIVOT**, **position=j** means **A(j,j)** has either a structural zero or a numerical zero. Otherwise **position=-1**.

The **position** can be 0-based or 1-based, the same as the matrix.

Function **cusparseXcsrsv2\_zeroPivot()** is a blocking call. It calls **cudaDeviceSynchronize()** to make sure all previous kernels are done.

The **position** can be in the host memory or device memory. The user can set the proper mode with **cusparseSetPointerMode()**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	<b>info</b> contains structural zero or numerical zero if the user already called <b>csrsv2_analysis()</b> or <b>csrsv2_solve()</b> .

### Output

<b>position</b>	if no structural or numerical zero, <b>position</b> is -1; otherwise, if <b>A(j,j)</b> is missing or <b>U(j,j)</b> is zero, <b>position=j</b> .
-----------------	---

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	<b>info</b> is not valid.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

## 7.14. `cusparse<T>hybmV()`

```

cusparseStatus_t
cusparseShybmV(cusparseHandle_t handle, cusparseOperation_t transA,
               const float *alpha,
               const cusparseMatDescr_t descrA,
               const cusparseHybMat_t hybA, const float *x,
               const float *beta, float *y)

cusparseStatus_t
cusparseDhybmV(cusparseHandle_t handle, cusparseOperation_t transA,
               const double *alpha,
               const cusparseMatDescr_t descrA,
               const cusparseHybMat_t hybA, const double *x,
               const double *beta, double *y)

cusparseStatus_t
cusparseChybmV(cusparseHandle_t handle, cusparseOperation_t transA,
               const cuComplex *alpha,
               const cusparseMatDescr_t descrA,
               const cusparseHybMat_t hybA, const cuComplex *x,

```

This function performs the matrix-vector operation

$$y = \alpha * \text{op}(A) * x + \beta * y$$

**A** is an **m**×**n** sparse matrix that is defined in the HYB storage format by an opaque data structure **hybA**, **x** and **y** are vectors,  $\alpha$  and  $\beta$  are scalars, and

$\text{op}(A) = \{ A \quad \text{if } \text{transA} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \}$

Notice that currently only  $\text{op}(A) = A$  is supported.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $\text{op}(A)$ (currently only $\text{op}(A) = A$ is supported).
<b>m</b>	number of rows of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>A</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> .
<b>hybA</b>	the matrix <b>A</b> in HYB storage format.
<b>x</b>	<type> vector of <b>n</b> elements.

<b>beta</b>	<type> scalar used for multiplication. If <b>beta</b> is zero, <b>y</b> does not have to be a valid input.
<b>y</b>	<type> vector of <b>m</b> elements.

### Output

<b>y</b>	<type> updated vector.
----------	------------------------

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	the internally stored HYB format parameters are invalid.
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 7.15. cusparse<t>hybsv\_analysis()

```

cusparseStatus_t
cusparseShybsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        const cusparseMatDescr_t descrA,
                        cusparseHybMat_t hybA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseDhybsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        const cusparseMatDescr_t descrA,
                        cusparseHybMat_t hybA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseChybsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        const cusparseMatDescr_t descrA,
                        cusparseHybMat_t hybA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseZhybsv_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        const cusparseMatDescr_t descrA,
                        cusparseHybMat_t hybA,
                        cusparseSolveAnalysisInfo_t info)

```

This function performs the analysis phase of the solution of a sparse triangular linear system

$$\text{op}(A) * y = \alpha * x$$

**A** is an  $m \times m$  sparse matrix that is defined in HYB storage format by an opaque data structure **hybA**, **x** and **y** are the right-hand-side and the solution vectors,  $\alpha$  is a scalar, and

$$\text{op}(A) = \{ A \quad \text{if } \text{transA} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \}$$

Notice that currently only  $\text{op}(A) = A$  is supported.

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a significant amount of extra storage that is proportional to the matrix size. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $\text{op}(A)$ (currently only $\text{op}(A) = A$ is supported).
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> and diagonal type <code>USPARSE_DIAG_TYPE_NON_UNIT</code> .
<b>hybA</b>	the matrix <b>A</b> in HYB storage format.
<b>info</b>	structure initialized using <code>cusparseCreateSolveAnalysisInfo()</code> .

### Output

<b>info</b>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------	---

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	the internally stored HYB format parameters are invalid.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 7.16. `cusparse<t>hybsv_solve()`

```

cusparseStatus_t
cusparseShybsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    const float      *alpha,
                    const cusparseMatDescr_t descrA,
                    cusparseHybMat_t hybA,
                    cusparseSolveAnalysisInfo_t info,
                    const float      *x, float      *y)

cusparseStatus_t
cusparseDhybsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    const double     *alpha,
                    const cusparseMatDescr_t descrA,
                    cusparseHybMat_t hybA,
                    cusparseSolveAnalysisInfo_t info,
                    const double     *x, double     *y)

cusparseStatus_t
cusparseChybsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    const cuComplex  *alpha,
                    const cusparseMatDescr_t descrA,
                    cusparseHybMat_t hybA,
                    cusparseSolveAnalysisInfo_t info,
                    const cuComplex  *x, cuComplex  *y)

cusparseStatus_t
cusparseZhybsv_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    const cuDoubleComplex *alpha,
                    const cusparseMatDescr_t descrA,
                    cusparseHybMat_t hybA,
                    cusparseSolveAnalysisInfo_t info,
                    const cuDoubleComplex *x, cuDoubleComplex *y)

```

This function performs the solve phase of the solution of a sparse triangular linear system:

$$\text{op}(A) * y = \alpha * x$$

**A** is an **m**×**m** sparse matrix that is defined in HYB storage format by an opaque data structure **hybA**, **x** and **y** are the right-hand-side and the solution vectors,  $\alpha$  is a scalar, and

$\text{op}(A) = \{ A \quad \text{if } \text{transA} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \}$

Notice that currently only  $\text{op}(A) = A$  is supported.

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
---------------	---

<b>transA</b>	the operation $\text{op}(A)$ (currently only $\text{op}(A) = A$ is supported).
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> and the diagonal type is <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<b>hybA</b>	the matrix <b>A</b> in HYB storage format.
<b>info</b>	structure with information collected during the analysis phase (that should be passed to the solve phase unchanged).
<b>x</b>	<type> right-hand-side vector of size <b>m</b> .

## Output

<b>y</b>	<type> solution vector of size <b>m</b> .
----------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	the internally stored hyb format parameters are invalid.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_MAPPING_ERROR</code>	the texture binding failed.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## Chapter 8.

# CUSPARSE LEVEL 3 FUNCTION REFERENCE

This chapter describes sparse linear algebra functions that perform operations between sparse and (usually tall) dense matrices.

In particular, the solution of sparse triangular linear systems with multiple right-hand sides is implemented in two phases. First, during the analysis phase, the sparse triangular matrix is analyzed to determine the dependencies between its elements by calling the appropriate `csrsm_analysis()` function. The analysis is specific to the sparsity pattern of the given matrix and to the selected `cusparseOperation_t` type. The information from the analysis phase is stored in the parameter of type `cusparseSolveAnalysisInfo_t` that has been initialized previously with a call to `cusparseCreateSolveAnalysisInfo()`.

Second, during the solve phase, the given sparse triangular linear system is solved using the information stored in the `cusparseSolveAnalysisInfo_t` parameter by calling the appropriate `csrsm_solve()` function. The solve phase may be performed multiple times with different multiple right-hand sides, while the analysis phase needs to be performed only once. This is especially useful when a sparse triangular linear system must be solved for different sets of multiple right-hand sides one at a time, while its coefficient matrix remains the same.

Finally, once all the solves have completed, the opaque data structure pointed to by the `cusparseSolveAnalysisInfo_t` parameter can be released by calling `cusparseDestroySolveAnalysisInfo()`. For more information please refer to [3].

## 8.1. `cusparse<t>csrmm()`

```
cusparseStatus_t
cusparseScsrmm(cusparseHandle_t handle,
               cusparseOperation_t transA,
               int m,
               int n,
               int k,
               int nnz,
               const float *alpha,
               const cusparseMatDescr_t descrA,
               const float *csrValA,
               const int *csrRowPtrA,
               const int *csrColIndA,
               const float *B,
               int ldb,
               const float *beta,
               float *C,
               int ldc)
```

```
cusparseStatus_t
cusparseDcsrmm(cusparseHandle_t handle,
               cusparseOperation_t transA,
               int m,
               int n,
               int k,
               int nnz,
               const double *alpha,
               const cusparseMatDescr_t descrA,
               const double *csrValA,
               const int *csrRowPtrA,
               const int *csrColIndA,
               const double *B,
               int ldb,
               const double *beta,
               double *C,
               int ldc)
```

```
cusparseStatus_t
cusparseCcsrmm(cusparseHandle_t handle,
               cusparseOperation_t transA,
               int m,
               int n,
               int k,
               int nnz,
               const cuComplex *alpha,
               const cusparseMatDescr_t descrA,
               const cuComplex *csrValA,
               const int *csrRowPtrA,
               const int *csrColIndA,
               const cuComplex *B,
               int ldb,
               const cuComplex *beta,
               cuComplex *C,
               int ldc)
```

```
cusparseStatus_t
cusparseZcsrmm(cusparseHandle_t handle,
               cusparseOperation_t transA,
               int m,
               int n,
               int k,
               int nnz,
               const cuDoubleComplex *alpha,
               const cusparseMatDescr_t descrA,
               const cuDoubleComplex *csrValA,
               const int *csrRowPtrA,
               const int *csrColIndA,
               const cuDoubleComplex *B,
```

This function performs one of the following matrix-matrix operations

$$C = \alpha * \text{op}(A) * B + \beta * C$$

where **A** is an **m**×**k** sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **B** and **C** are dense matrices;  $\alpha$  and  $\beta$  are scalars; and

$$\text{op}(A) = \begin{cases} A & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ A^T & \text{if trans} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ A^H & \text{if trans} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

When using the (conjugate) transpose of a general matrix or a Hermitian/symmetric matrix, this routine may produce slightly different results with the same input parameters during different runs of this function. For these matrix types it uses atomic operations to compute the final result; consequently, many threads may be adding floating point numbers to the same memory location without any specific ordering, which may produce slightly different results for each run.

If exactly the same output is required for any input when multiplying by the transpose of a general matrix, the following procedure can be used:

1. Convert the matrix from CSR to CSC format using one of the **csr2csc()** functions. Notice that by interchanging the rows and columns of the result you are implicitly transposing the matrix.
2. Call the **csrmm()** function with the **cusparsOperation\_t** parameter set to **CUSPARSE\_OPERATION\_NON\_TRANPOSE** and with the interchanged rows and columns of the matrix stored in CSC format. This (implicitly) multiplies the vector by the transpose of the matrix in the original CSR format.

This function requires no extra storage for the general matrices when operation **CUSPARSE\_OPERATION\_NON\_TRANPOSE** is selected. It requires some extra storage for Hermitian/symmetric matrices and for the general matrices when an operation different from **CUSPARSE\_OPERATION\_NON\_TRANPOSE** is selected. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation <b>op(A)</b>
<b>m</b>	number of rows of sparse matrix <b>A</b> .
<b>n</b>	number of columns of dense matrices <b>B</b> and <b>C</b> .
<b>k</b>	number of columns of sparse matrix <b>A</b> .
<b>nnz</b>	number of nonzero elements of sparse matrix <b>A</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix types are <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , <b>CUSPARSE_MATRIX_TYPE_SYMMETRIC</b> , and <b>CUSPARSE_MATRIX_TYPE_HERMITIAN</b> . Also, the supported index bases are

	CUSPARSE_INDEX_BASE_ZERO and CUSPARSE_INDEX_BASE_ONE.
<b>csrValA</b>	<type> array of $nnz (= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0))$ nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of $m + 1$ elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of $nnz (= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0))$ column indices of the nonzero elements of matrix <b>A</b> .
<b>B</b>	array of dimensions $(ldb, n)$ .
<b>ldb</b>	leading dimension of <b>B</b> . It must be at least $\max(1, k)$ if $op(A) = A$ and at least $\max(1, m)$ otherwise.
<b>beta</b>	<type> scalar used for multiplication. If <b>beta</b> is zero, <b>c</b> does not have to be a valid input.
<b>C</b>	array of dimensions $(ldc, n)$ .
<b>ldc</b>	leading dimension of <b>c</b> . It must be at least $\max(1, m)$ if $op(A) = A$ and at least $\max(1, k)$ otherwise.

## Output

<b>c</b>	<type> updated array of dimensions $(ldc, n)$ .
----------	---

## Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( $m, n, k, nnz < 0$ or $ldb$ and $ldc$ are incorrect).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 8.2. `cusparse<t>csrmm2()`

```

cusparseStatus_t
cusparseScsrmm2(cusparseHandle_t      handle,

                int                     ldc)

```

```

cusparseStatus_t
cusparseZcsrmm2(cusparseHandle_t      handle,
                cusparseOperation_t    transA,
                cusparseOperation_t    transB,
                int                     m,
                int                     n,
                int                     k,
                int                     nnz,
                const cuDoubleComplex    *alpha,
                const cusparseMatDescr_t descrA,

```

This function performs one of the following matrix-matrix operations

$$C = \alpha * \text{op}(A) * \text{op}(B) + \beta * C$$

where **A** is an **m×k** sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **B** and **C** are dense matrices;  $\alpha$  and  $\beta$  are scalars; and

$$\text{op}(A) = \begin{cases} A & \text{if transA} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ A^T & \text{if transA} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ A^H & \text{if transA} == \text{CUSPARSE\_OPERATION\_CONJUGATE\_TRANPOSE} \end{cases}$$

,

$$\text{op}(B) = \begin{cases} B & \text{if transB} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ B^T & \text{if transB} == \text{CUSPARSE\_OPERATION\_TRANPOSE} \\ B^H & \text{not supported} \end{cases}$$

If **op(B)=B**, **cusparse<t>csrmm2()** is the same as **cusparse<t>csrmm()**; otherwise, only **op(A)=A** is supported and the matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**.

The motivation of **transpose(B)** is to improve the memory access of matrix **B**. The computational pattern of **A\*transpose(B)** with matrix **B** in column-major order is equivalent to **A\*B** with matrix **B** in row-major order.

In practice, no operation in iterative solver or eigenvalue solver uses **A\*transpose(B)**. However we can perform **A\*transpose(transpose(B))** which is the same as **A\*B**. For example, suppose **A** is **m×k**, **B** is **k×n** and **C** is **m×n**, the following code shows usage of **cusparseDcsrmm()**.

```
// A is m*k, B is k*n and C is m*n
const int ldb_B = k; // leading dimension of B
const int ldc   = m; // leading dimension of C
// perform C:=alpha*A*B + beta*C
cusparseSetMatType(descrA, CUSPARSE_MATRIX_TYPE_GENERAL);
cusparseDcsrmm2(cusparse_handle,
    CUSPARSE_OPERATION_NON_TRANPOSE,
    m, n, k, nnz, alpha,
    descrA, csrValA, csrRowPtrA, csrColIndA,
    B, ldb_B,
    beta, C, ldc);
```

Instead of using **A\*B**, our proposal is to transpose **B** to **Bt** first by calling **cublas<t>geam()**, then to perform **A\*transpose(Bt)**.

```
// step 1: Bt := transpose(B)
double *Bt;
const int ldb_Bt = n; // leading dimension of Bt
cudaMalloc((void**)&Bt, sizeof(double)*ldb_Bt*k);
double one = 1.0;
double zero = 0.0;
cublasSetPointerMode(cublas_handle, CUBLAS_POINTER_MODE_HOST);
cublasDgeam(cublas_handle, CUBLAS_OP_T, CUBLAS_OP_T,
            n, k, &one, B, int ldb_B, &zero, B, int ldb_B, Bt, ldb_Bt);

// step 2: perform C:=alpha*A*transpose(Bt) + beta*C
cusparseDcsrmm2(cusparse_handle,
                CUSPARSE_OPERATION_NON_TRANSPOSE,
                CUSPARSE_OPERATION_TRANSPOSE,
                m, n, k, nnz, alpha,
                descrA, csrValA, csrRowPtrA, csrColIndA,
                Bt, ldb_Bt,
                beta, C, ldc);
```

Remark 1: **cublas<t>geam()** and **cusparse<t>csrmm2()** are memory bound. The complexity of **cublas<t>geam()** is  $2*n*k$ , and the minimum complexity of **cusparse<t>csrmm2()** is about  $(nnz + nnz*n + 2*m*n)$ . If **nnz** per column ( $=nnz/k$ ) is large, it is worth paying the extra cost on transposition because **A\*transpose(B)** may be  $2\times$  faster than **A\*B** if the sparsity pattern of **A** is not good.

Remark 2: **A\*transpose(B)** is only supported on compute capability 2.0 and above.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $op(A)$
<b>transB</b>	the operation $op(B)$
<b>m</b>	number of rows of sparse matrix <b>A</b> .
<b>n</b>	number of columns of dense matrix $op(B)$ and <b>C</b> .
<b>k</b>	number of columns of sparse matrix <b>A</b> .
<b>nnz</b>	number of nonzero elements of sparse matrix <b>A</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix types are <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> , <b>CUSPARSE_MATRIX_TYPE_SYMMETRIC</b> , and <b>CUSPARSE_MATRIX_TYPE_HERMITIAN</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m</b> + 1 elements that contains the start of every row and the end of the last row plus one.

<code>csrColIndA</code>	integer array of <code>nnz</code> ( <code>= csrRowPtrA(m) - csrRowPtrA(0)</code> ) column indices of the nonzero elements of matrix <code>A</code> .
<code>B</code>	array of dimensions <code>(ldb, n)</code> if <code>op(B)=B</code> and <code>(ldb, k)</code> otherwise.
<code>ldb</code>	leading dimension of <code>B</code> . If <code>op(B)=B</code> , it must be at least <code>max(1, k)</code> if <code>op(A)=A</code> and at least <code>max(1, m)</code> otherwise. If <code>op(B) != B</code> , it must be at least <code>max(1, n)</code> .
<code>beta</code>	<type> scalar used for multiplication. If <code>beta</code> is zero, <code>c</code> does not have to be a valid input.
<code>C</code>	array of dimensions <code>(ldc, n)</code> .
<code>ldc</code>	leading dimension of <code>c</code> . It must be at least <code>max(1, m)</code> if <code>op(A)=A</code> and at least <code>max(1, k)</code> otherwise.

## Output

<code>c</code>	<type> updated array of dimensions <code>(ldc, n)</code> .
----------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m</code> , <code>n</code> , <code>k</code> , <code>nnz</code> <0 or <code>ldb</code> and <code>ldc</code> are incorrect).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	if <code>op(B)=B</code> , the device does not support double precision or if <code>op(B)=transpose(B)</code> the device is below compute capability 2.0.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	<code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> is not supported if <code>op(B)=B</code> , and only <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> is supported otherwise.

## 8.3. `cusparse<t>csrsm_analysis()`

```

cusparseStatus_t
cusparseScsrsm_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz,
                        const cusparseMatDescr_t descrA,
                        const float *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseDcsrsm_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz,
                        const cusparseMatDescr_t descrA,
                        const double *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseCcsrsm_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz,
                        const cusparseMatDescr_t descrA,
                        const cuComplex *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseZcsrsm_analysis(cusparseHandle_t handle,
                        cusparseOperation_t transA,
                        int m, int nnz,
                        const cusparseMatDescr_t descrA,
                        const cuDoubleComplex *csrValA,
                        const int *csrRowPtrA, const int *csrColIndA,
                        cusparseSolveAnalysisInfo_t info)

```

This function performs the analysis phase of the solution of a sparse triangular linear system

$$\text{op}(A) * Y = \alpha * X$$

with multiple right-hand sides, where **A** is an **m**×**m** sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **X** and **Y** are the right-hand-side and the solution dense matrices;  $\alpha$  is a scalar; and

$$\text{op}(A) = \begin{cases} A & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ A^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ A^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

It is expected that this function will be executed only once for a given matrix and a particular operation type.

This function requires a significant amount of extra storage that is proportional to the matrix size. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $\text{op}(A)$ .
<b>m</b>	number of rows of matrix <b>A</b> .
<b>nnz</b>	number of nonzero elements of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix types are <code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> and <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> , while the supported diagonal types are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<b>csrValA</b>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure initialized using <code>cusparsesolveCreateSolveAnalysisInfo()</code> .

## Output

<b>info</b>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 8.4. `cusparse<t>csrsm_solve()`

```

cusparseStatus_t
cusparseScsrsm_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,

                    cuComplex *Y, int ldy)

cusparseStatus_t
cusparseZcsrsm_solve(cusparseHandle_t handle,
                    cusparseOperation_t transA,
                    int m, int n, const cuDoubleComplex *alpha,
                    const cusparseMatDescr_t descrA,
                    const cuDoubleComplex *csrValA,
                    const int *csrRowPtrA, const int *csrColIndA,
                    cusparseSolveAnalysisInfo_t info,
                    const cuDoubleComplex *X, int ldx,
                    cuDoubleComplex *Y, int ldy)

```

This function performs the solve phase of the solution of a sparse triangular linear system

$$\text{op}(A) * Y = \alpha * X$$

with multiple right-hand sides, where **A** is an **m**×**n** sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**; **X** and **Y** are the right-hand-side and the solution dense matrices;  $\alpha$  is a scalar; and

$$\text{op}(A) = \begin{cases} A & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ A^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ A^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

This function may be executed multiple times for a given matrix and a particular operation type.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $\text{op}(A)$ .
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>x</b> and <b>y</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix types are <code>CUSPARSE_MATRIX_TYPE_TRIANGULAR</code> and <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> , while the supported diagonal types are <code>CUSPARSE_DIAG_TYPE_UNIT</code> and <code>CUSPARSE_DIAG_TYPE_NON_UNIT</code> .
<b>csrValA</b>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure with information collected during the analysis phase (that should be passed to the solve phase unchanged).
<b>x</b>	<type> right-hand-side array of dimensions <code>(ldx, n)</code> .
<b>ldx</b>	leading dimension of <b>x</b> (that is $\geq \max(1, m)$ ).

### Output

<b>y</b>	<type> solution array of dimensions <code>(ldy, n)</code> .
<b>ldy</b>	leading dimension of <b>y</b> (that is $\geq \max(1, m)$ ).

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_MAPPING_ERROR</code>	the texture binding failed.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.

CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

# Chapter 9.

## CUSPARSE EXTRA FUNCTION REFERENCE

This chapter describes the extra routines used to manipulate sparse matrices.

## 9.1. `cusparse<t>csrgeam()`

```

cusparseStatus_t
cusparseXcsrgeamNnz(cusparseHandle_t handle, int m, int n,
    const cusparseMatDescr_t descrA, int nnzA,

    const int *csrColIndB,
    const cusparseMatDescr_t descrC,
    cuDoubleComplex *csrValC, int *csrRowPtrC, int *csrColIndC)

```

This function performs following matrix-matrix operation

$$C = \alpha * A + \beta * B$$

where **A**, **B**, and **C** are  $m \times n$  sparse matrices (defined in CSR storage format by the three arrays **csrValA**|**csrValB**|**csrValC**, **csrRowPtrA**|**csrRowPtrB**|**csrRowPtrC**, and **csrColIndA**|**csrColIndB**|**csrColIndC** respectively), and  $\alpha$  and  $\beta$  are scalars. Since **A** and **B** have different sparsity patterns, cuSPARSE adopts a two-step approach to complete sparse matrix **C**. In the first step, the user allocates **csrRowPtrC** of  $m+1$  elements and uses function **cusparseXcsrgeamNnz()** to determine **csrRowPtrC** and the total number of nonzero elements. In the second step, the user gathers **nnzC** (number of nonzero elements of matrix **C**) from either (**nnzC**=**\*nnzTotalDevHostPtr**) or (**nnzC**=**csrRowPtrC(m) - csrRowPtrC(0)**) and allocates **csrValC**, **csrColIndC** of **nnzC** elements respectively, then finally calls function **cusparse[S|D|C|Z]csrgeam()** to complete matrix **C**.

The general procedure is as follows:

```
int baseC, nnzC;
// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzC;
cusparseSetPointerNode(handle, CUSPARSE_POINTER_MODE_HOST);
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
cusparseXcsrgeamNnz(handle, m, n,
    descrA, nnzA, csrRowPtrA, csrColIndA,
    descrB, nnzB, csrRowPtrB, csrColIndB,
    descrC, csrRowPtrC, nnzTotalDevHostPtr);
if (NULL != nnzTotalDevHostPtr){
    nnzC = *nnzTotalDevHostPtr;
}else{
    cudaMemcpy(&nnzC, csrRowPtrC+m, sizeof(int), cudaMemcpyDeviceToHost);
    cudaMemcpy(&baseC, csrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
    nnzC -= baseC;
}
cudaMalloc((void**)&csrColIndC, sizeof(int)*nnzC);
cudaMalloc((void**)&csrValC, sizeof(float)*nnzC);
cusparseScsrgeam(handle, m, n,
    alpha,
    descrA, nnzA,
    csrValA, csrRowPtrA, csrColIndA,
    beta,
    descrB, nnzB,
    csrValB, csrRowPtrB, csrColIndB,
    descrC,
    csrValC, csrRowPtrC, csrColIndC);
```

Several comments on **csrgeam()**:

- ▶ The other three combinations, NT, TN, and TT, are not supported by cuSPARSE. In order to do any one of the three, the user should use the routine **csr2csc()** to convert  $A|B$  to  $A^T|B^T$ .
- ▶ Only **CUSPARSE\_MATRIX\_TYPE\_GENERAL** is supported. If either **A** or **B** is symmetric or Hermitian, then the user must extend the matrix to a full one and reconfigure the **MatrixType** field of the descriptor to **CUSPARSE\_MATRIX\_TYPE\_GENERAL**.
- ▶ If the sparsity pattern of matrix **C** is known, the user can skip the call to function **cusparseXcsrgeamNnz()**. For example, suppose that the user has an iterative algorithm which would update **A** and **B** iteratively but keep the sparsity patterns. The user can call function **cusparseXcsrgeamNnz()** once to set up the sparsity pattern of **C**, then call function **cusparse[S|D|C|Z]geam()** only for each iteration.
- ▶ The pointers **alpha** and **beta** must be valid.

- When **alpha** or **beta** is zero, it is not considered a special case by cuSPARSE. The sparsity pattern of **C** is independent of the value of **alpha** and **beta**. If the user wants  $C = 0 \times A + 1 \times B^T$ , then **csr2csc()** is better than **csrgeam()**.

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of sparse matrix <b>A</b> , <b>B</b> , <b>C</b> .
<b>n</b>	number of columns of sparse matrix <b>A</b> , <b>B</b> , <b>C</b> .
<b>alpha</b>	<type> scalar used for multiplication.
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> only.
<b>nnzA</b>	number of nonzero elements of sparse matrix <b>A</b> .
<b>csrValA</b>	<type> array of <b>nnzA</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m</b> + 1 elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnzA</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) column indices of the nonzero elements of matrix <b>A</b> .
<b>beta</b>	<type> scalar used for multiplication. If <b>beta</b> is zero, <b>y</b> does not have to be a valid input.
<b>descrB</b>	the descriptor of matrix <b>B</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> only.
<b>nnzB</b>	number of nonzero elements of sparse matrix <b>B</b> .
<b>csrValB</b>	<type> array of <b>nnzB</b> ( $= \text{csrRowPtrB}(m) - \text{csrRowPtrB}(0)$ ) nonzero elements of matrix <b>B</b> .
<b>csrRowPtrB</b>	integer array of <b>m</b> + 1 elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndB</b>	integer array of <b>nnzB</b> ( $= \text{csrRowPtrB}(m) - \text{csrRowPtrB}(0)$ ) column indices of the nonzero elements of matrix <b>B</b> .
<b>descrC</b>	the descriptor of matrix <b>C</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> only.

## Output

<b>csrValC</b>	<type> array of <b>nnzC</b> ( $= \text{csrRowPtrC}(m) - \text{csrRowPtrC}(0)$ ) nonzero elements of matrix <b>C</b> .
<b>csrRowPtrC</b>	integer array of <b>m</b> + 1 elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndC</b>	integer array of <b>nnzC</b> ( $= \text{csrRowPtrC}(m) - \text{csrRowPtrC}(0)$ ) column indices of the nonzero elements of matrix <b>C</b> .

<code>nnzTotalDevHostPtr</code>	total number of nonzero elements in device or host memory. It is equal to <code>(csrRowPtrC(m) - csrRowPtrC(0))</code> .
---------------------------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, n, nnz &lt; 0</code> , <code>IndexBase</code> of <code>descrA, descrB, descrC</code> is not base-0 or base-1, or <code>alpha</code> or <code>beta</code> is nil).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 9.2. `cusparse<t>csrgermm()`

```

cusparseStatus_t
cusparseXcsrgermmNnz(cusparseHandle_t handle,
    cusparseOperation_t transA, cusparseOperation_t transB,
    int m, int n, int k,
    const cusparseMatDescr_t descrA, const int nnzA,

    const int *csrRowPtrA, const int *csrColIndA,
    const cusparseMatDescr_t descrB, const int nnzB,

    const int *csrRowPtrB, const int *csrColIndB,
    const cusparseMatDescr_t descrC, int *csrRowPtrC,
    int *nnzTotalDevHostPtr )
cusparseStatus_t
cusparseScsrgermm(cusparseHandle_t handle,
    cusparseOperation_t transA, cusparseOperation_t transB,
    int m, int n, int k,
    const cusparseMatDescr_t descrA, const int nnzA,
    const float *csrValA,
    const int *csrRowPtrA, const int *csrColIndA,
    const cusparseMatDescr_t descrB, const int nnzB,

    const float *csrValB,
    const int *csrRowPtrB, const int *csrColIndB,
    const cusparseMatDescr_t descrC,
    float *csrValC,
    const int *csrRowPtrC, int *csrColIndC )
cusparseStatus_t
cusparseDcsrgermm(cusparseHandle_t handle,

    const cusparseMatDescr_t descrB, const int nnzB,

    const double *csrValB,
    const int *csrRowPtrB, const int *csrColIndB,
    const cusparseMatDescr_t descrC,
    double *csrValC,
    const int *csrRowPtrC, int *csrColIndC )
cusparseStatus_t
cusparseCcsrgermm(cusparseHandle_t handle,
    cusparseOperation_t transA, cusparseOperation_t transB,
    int m, int n, int k,
    const cusparseMatDescr_t descrA, const int nnzA,
    const cuComplex *csrValA,
    const int *csrRowPtrA, const int *csrColIndA,
    const cusparseMatDescr_t descrB, const int nnzB,

    const cuComplex *csrValB,
    const int *csrRowPtrB, const int *csrColIndB,
    const cusparseMatDescr_t descrC,
    cuComplex *csrValC,
    const int *csrRowPtrC, int *csrColIndC )
cusparseStatus_t
cusparseZcsrgermm(cusparseHandle_t handle,
    cusparseOperation_t transA, cusparseOperation_t transB,
    int m, int n, int k,
    const cusparseMatDescr_t descrA, const int nnzA,
    const cuDoubleComplex *csrValA,
    const int *csrRowPtrA, const int *csrColIndA,
    const cusparseMatDescr_t descrB, const int nnzB,
    const cuDoubleComplex *csrValB,
    const int *csrRowPtrB, const int *csrColIndB,

```

This function performs following matrix-matrix operation:

$$C = \text{op}(A) * \text{op}(B)$$

where  $\text{op}(A)$ ,  $\text{op}(B)$  and  $C$  are  $m \times k$ ,  $k \times n$ , and  $m \times n$  sparse matrices (defined in CSR storage format by the three arrays **csrValA**|**csrValB**|**csrValC**, **csrRowPtrA**|**csrRowPtrB**|**csrRowPtrC**, and **csrColIndA**|**csrColIndB**|**csrColIndC** respectively. The operation is defined by

$$\text{op}(A) = \begin{cases} A & \text{if trans} == \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \\ A^T & \text{if trans} != \text{CUSPARSE\_OPERATION\_NON\_TRANPOSE} \end{cases}$$

There are four versions, NN, NT, TN, and TT. NN stands for  $C = A * B$ , NT stands for  $C = A * B^T$ , TN stands for  $C = A^T * B$  and TT stands for  $C = A^T * A^T$ .

The cuSPARSE library adopts a two-step approach to complete sparse matrix. In the first step, the user allocates **csrRowPtrC** of  $m+1$  elements and uses the function **cusparseXcsrsgemmNnz()** to determine **csrRowPtrC** and the total number of nonzero elements. In the second step, the user gathers **nnzC** (the number of nonzero elements of matrix **C**) from either (**nnzC=\*nnzTotalDevHostPtr**) or (**nnzC=csrRowPtrC(m) - csrRowPtrC(0)**) and allocates **csrValC** and **csrColIndC** of **nnzC** elements respectively, then finally calls function **cusparse[S|D|C|Z]csrsgemm()** to complete matrix **C**.

The general procedure is as follows:

```
int baseC, nnzC;
// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzC;
cusparseSetPointerMode(handle, CUSPARSE_POINTER_MODE_HOST);
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
cusparseXcsrsgemmNnz(handle, m, n, k,
    descrA, nnzA, csrRowPtrA, csrColIndA,
    descrB, nnzB, csrRowPtrB, csrColIndB,
    descrC, csrRowPtrC, nnzTotalDevHostPtr );
if (NULL != nnzTotalDevHostPtr){
    nnzC = *nnzTotalDevHostPtr;
}else{
    cudaMemcpy(&nnzC, csrRowPtrC+m, sizeof(int), cudaMemcpyDeviceToHost);
    cudaMemcpy(&baseC, csrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
    nnzC -= baseC;
}
cudaMalloc((void**)&csrColIndC, sizeof(int)*nnzC);
cudaMalloc((void**)&csrValC, sizeof(float)*nnzC);
cusparseScsrsgemm(handle, transA, transB, m, n, k,
    descrA, nnzA,
    csrValA, csrRowPtrA, csrColIndA,
    descrB, nnzB,
    csrValB, csrRowPtrB, csrColIndB,
    descrC,
    csrValC, csrRowPtrC, csrColIndC);
```

Several comments on **csrsgemm()**:

- Only the NN version is implemented. For the NT version, matrix **C** is converted to  $B^T$  by **csr2csc()** and then call the NN version. The same technique applies to TN and TT. The **csr2csc()** routine allocates working space implicitly; if the user needs memory management, then the NN version is better.
- The NN version needs working space of size **nnzA** integers at least.

- ▶ Only **CUSPARSE\_MATRIX\_TYPE\_GENERAL** is supported. If either **A** or **B** is symmetric or Hermitian, the user must extend the matrix to a full one and reconfigure the **MatrixType** field descriptor to **CUSPARSE\_MATRIX\_TYPE\_GENERAL**.
- ▶ Only devices of compute capability 2.0 or above are supported.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>transA</b>	the operation $\text{op}(A)$
<b>transB</b>	the operation $\text{op}(B)$
<b>m</b>	number of rows of sparse matrix $\text{op}(A)$ and <b>c</b> .
<b>n</b>	number of columns of sparse matrix $\text{op}(B)$ and <b>c</b> .
<b>k</b>	number of columns/rows of sparse matrix $\text{op}(A)$ / $\text{op}(B)$ .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> only.
<b>nnzA</b>	number of nonzero elements of sparse matrix <b>A</b> .
<b>csrValA</b>	<type> array of <b>nnzA</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of $\tilde{m} + 1$ elements that contains the start of every row and the end of the last row plus one. $\tilde{m} = m$ if <b>transA</b> == <b>CUSPARSE_OPERATION_NON_TRANSPOSE</b> , otherwise $\tilde{m} = k$ .
<b>csrColIndA</b>	integer array of <b>nnzA</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) column indices of the nonzero elements of matrix <b>A</b> .
<b>descrB</b>	the descriptor of matrix <b>B</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> only.
<b>nnzB</b>	number of nonzero elements of sparse matrix <b>B</b> .
<b>csrValB</b>	<type> array of <b>nnzB</b> nonzero elements of matrix <b>B</b> .
<b>csrRowPtrB</b>	integer array of $\tilde{k} + 1$ elements that contains the start of every row and the end of the last row plus one. $\tilde{k} = k$ if <b>transB</b> == <b>CUSPARSE_OPERATION_NON_TRANSPOSE</b> , otherwise $\tilde{k} = n$
<b>csrColIndB</b>	integer array of <b>nnzB</b> column indices of the nonzero elements of matrix <b>B</b> .
<b>descrC</b>	the descriptor of matrix <b>c</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> only.

### Output

<b>csrValC</b>	<type> array of <b>nnzC</b> ( $= \text{csrRowPtrC}(m) - \text{csrRowPtrC}(0)$ ) nonzero elements of matrix <b>c</b> .
----------------	---

<code>csrRowPtrC</code>	integer array of $m+1$ elements that contains the start of every row and the end of the last row plus one.
<code>csrColIndC</code>	integer array of $nnzC$ ( $= \text{csrRowPtrC}(m) - \text{csrRowPtrC}(0)$ ) column indices of the nonzero elements of matrix $c$ .
<code>nnzTotalDevHostPtr</code>	total number of nonzero elements in device or host memory. It is equal to $(\text{csrRowPtrC}(m) - \text{csrRowPtrC}(0))$ .

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( $m, n, k < 0$ ; <code>IndexBase</code> of <code>descrA</code> , <code>descrB</code> , <code>descrC</code> is not base-0 or base-1; or <code>alpha</code> or <code>beta</code> is nil).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

# Chapter 10.

## CUSPARSE PRECONDITIONERS REFERENCE

This chapter describes the routines that implement different preconditioners.

In particular, the incomplete factorizations are implemented in two phases. First, during the analysis phase, the sparse triangular matrix is analyzed to determine the dependencies between its elements by calling the appropriate `csrsv_analysis()` function. The analysis is specific to the sparsity pattern of the given matrix and the selected `cusparseOperation_t` type. The information from the analysis phase is stored in the parameter of type `cusparseSolveAnalysisInfo_t` that has been initialized previously with a call to `cusparseCreateSolveAnalysisInfo()`.

Second, during the numerical factorization phase, the given coefficient matrix is factorized using the information stored in the `cusparseSolveAnalysisInfo_t` parameter by calling the appropriate `csrilu0()` or `csric0()` function.

The analysis phase is shared across the sparse triangular solve, and the incomplete factorization and must be performed only once. The resulting information can be passed to the numerical factorization and the sparse triangular solve multiple times.

Finally, once the incomplete factorization and all the sparse triangular solves have completed, the opaque data structure pointed to by the `cusparseSolveAnalysisInfo_t` parameter can be released by calling `cusparseDestroySolveAnalysisInfo()`.

## 10.1. `cusparse<t>csric0()`

```

cusparseStatus_t
cusparseScsric0(cusparseHandle_t handle, cusparseOperation_t trans,
               int m, const cusparseMatDescr_t descrA,
               float *csrValM,
               const int *csrRowPtrA, const int *csrColIndA,
               cusparseSolveAnalysisInfo_t info)
cusparseStatus_t
cusparseDcsric0(cusparseHandle_t handle, cusparseOperation_t trans,
               int m, const cusparseMatDescr_t descrA,
               double *csrValM,
               const int *csrRowPtrA, const int *csrColIndA,
               cusparseSolveAnalysisInfo_t info)
cusparseStatus_t
cusparseCcsric0(cusparseHandle_t handle, cusparseOperation_t trans,
               int m, const cusparseMatDescr_t descrA,
               cuComplex *csrValM,
               const int *csrRowPtrA, const int *csrColIndA,
               cusparseSolveAnalysisInfo_t info)
cusparseStatus_t
cusparseZcsric0(cusparseHandle_t handle, cusparseOperation_t trans,
               int m, const cusparseMatDescr_t descrA,
               cuDoubleComplex *csrValM,
               const int *csrRowPtrA, const int *csrColIndA,
               cusparseSolveAnalysisInfo_t info)

```

This function computes the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

$$\text{op}(\mathbf{A}) \approx \mathbf{R}^T \mathbf{R}$$

$\mathbf{A}$  is an  $m \times m$  Hermitian/symmetric positive definite sparse matrix that is defined in CSR storage format by the three arrays `csrValM`, `csrRowPtrA`, and `csrColIndA`; and

$$\text{op}(\mathbf{A}) = \begin{cases} \mathbf{A} & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ \mathbf{A}^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ \mathbf{A}^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

Notice that only a lower or upper Hermitian/symmetric part of the matrix  $\mathbf{A}$  is actually stored. It is overwritten by the lower or upper triangular factors  $\mathbf{R}^T$  and  $\mathbf{R}$ , respectively.

A call to this routine must be preceded by a call to the `csrsv_analysis()` routine.

This function requires some extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>trans</b>	the operation $\text{op}(\mathbf{A})$ .
<b>m</b>	number of rows and columns of matrix $\mathbf{A}$ .
<b>descrA</b>	the descriptor of matrix $\mathbf{A}$ . The supported matrix types are <code>CUSPARSE_MATRIX_TYPE_SYMMETRIC</code> and <code>CUSPARSE_MATRIX_TYPE_HERMITIAN</code> .

	Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<code>csrValM</code>	<type> array of <code>nnz</code> ( = <code>csrRowPtrA(m) - csrRowPtrA(0)</code> ) nonzero elements of matrix <b>A</b> .
<code>csrRowPtrA</code>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<code>csrColIndA</code>	integer array of <code>nnz</code> ( = <code>csrRowPtrA(m) - csrRowPtrA(0)</code> ) column indices of the nonzero elements of matrix <b>A</b> .
<code>info</code>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).

## Output

<code>csrValM</code>	<type> matrix containing the incomplete-Cholesky lower or upper triangular factor.
----------------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 10.2. `cusparse<t>csric02_bufferSize()`

```

cusparseStatus_t
cusparseScsric02_bufferSize(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           float *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csric02Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseDcsric02_bufferSize(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           double *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csric02Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseCcsric02_bufferSize(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           cuComplex *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csric02Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseZcsric02_bufferSize(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           cuDoubleComplex *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csric02Info_t info,
                           int *pBufferSize);

```

This function returns size of buffer used in computing the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

$$A \approx LL^H$$

**A** is an **m**×**m** sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**.

The buffer size depends on dimension **m** and **nnz**, the number of nonzeros of the matrix. If the user changes the matrix, it is necessary to call **csric02\_bufferSize()** again to have the correct buffer size; otherwise, a segmentation fault may occur.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzeros of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m</b> + 1 elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) column indices of the nonzero elements of matrix <b>A</b> .

### Output

<b>info</b>	record internal states based on different algorithms.
<b>pBufferSize</b>	number of bytes of the buffer used in <b>csric02_analysis()</b> and <b>csric02()</b> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>nnz</b> ≤ 0), base index is not 0 or 1.
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device only supports compute capability 2.0 and above.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 10.3. `cusparse<t>csric02_analysis()`

```

cusparseStatus_t
cusparseScsric02_analysis(cusparseHandle_t handle,
                          int m,
                          int nnz,
                          const cusparseMatDescr_t descrA,
                          const float *csrValA,
                          const int *csrRowPtrA,
                          const int *csrColIndA,
                          csric02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);

cusparseStatus_t
cusparseDcsric02_analysis(cusparseHandle_t handle,
                          int m,
                          int nnz,
                          const cusparseMatDescr_t descrA,
                          const double *csrValA,
                          const int *csrRowPtrA,
                          const int *csrColIndA,
                          csric02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);

cusparseStatus_t
cusparseCcsric02_analysis(cusparseHandle_t handle,
                          int m,
                          int nnz,
                          const cusparseMatDescr_t descrA,
                          const cuComplex *csrValA,
                          const int *csrRowPtrA,
                          const int *csrColIndA,
                          csric02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);

cusparseStatus_t
cusparseZcsric02_analysis(cusparseHandle_t handle,
                          int m,
                          int nnz,
                          const cusparseMatDescr_t descrA,
                          const cuDoubleComplex *csrValA,
                          const int *csrRowPtrA,
                          const int *csrColIndA,
                          csric02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);

```

This function performs the analysis phase of the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

$$A \approx LL^H$$

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**.

This function requires a buffer size returned by **csric02\_bufferSize()**. The address of **pBuffer** must be multiple of 128 bytes. If not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **csric02\_analysis()** reports a structural zero and computes level information stored in the opaque structure **info**. The level information can extract more parallelism during incomplete Cholesky factorization. However **csric02()** can be done without level information. To disable level information, the user must specify the policy of **csric02\_analysis()** and **csric02()** as **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**.

Function **csric02\_analysis()** always reports the first structural zero, even if the policy is **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**. The user needs to call **cusparseXcsric02\_zeroPivot()** to know where the structural zero is.

It is the user's choice whether to call **csric02()** if **csric02\_analysis()** reports a structural zero. In this case, the user can still call **csric02()**, which will return a numerical zero at the same position as the structural zero. However the result is meaningless.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzeros of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m</b> + 1 elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure initialized using <b>cusparseCreateCsric02Info()</b> .
<b>policy</b>	the supported policies are <b>CUSPARSE_SOLVE_POLICY_NO_LEVEL</b> and <b>CUSPARSE_SOLVE_POLICY_USE_LEVEL</b> .
<b>pBuffer</b>	buffer allocated by the user; the size is returned by <b>csric02_bufferSize()</b> .

### Output

<code>info</code>	number of bytes of the buffer used in <code>csric02_analysis()</code> and <code>csric02()</code> .
-------------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt;= 0</code> ), base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 10.4. `cusparse<t>csric02()`

```

cusparseStatus_t
cusparseScsric02(cusparseHandle_t handle,
                 int m,
                 int nnz,
                 const cusparseMatDescr_t descrA,
                 float *csrValA_valM,
                 const int *csrRowPtrA,
                 const int *csrColIndA,
                 csric02Info_t info,
                 cusparseSolvePolicy_t policy,
                 char *pBuffer);

cusparseStatus_t
cusparseDcsric02(cusparseHandle_t handle,
                 int m,
                 int nnz,
                 const cusparseMatDescr_t descrA,
                 double *csrValA_valM,
                 const int *csrRowPtrA,
                 const int *csrColIndA,
                 csric02Info_t info,
                 cusparseSolvePolicy_t policy,
                 char *pBuffer);

cusparseStatus_t
cusparseCcsric02(cusparseHandle_t handle,
                 int m,
                 int nnz,
                 const cusparseMatDescr_t descrA,
                 cuComplex *csrValA_valM,
                 const int *csrRowPtrA,
                 const int *csrColIndA,
                 csric02Info_t info,
                 cusparseSolvePolicy_t policy,
                 char *pBuffer);

cusparseStatus_t
cusparseZcsric02(cusparseHandle_t handle,
                 int m,
                 int nnz,
                 const cusparseMatDescr_t descrA,
                 cuDoubleComplex *csrValA_valM,
                 const int *csrRowPtrA,
                 const int *csrColIndA,
                 csric02Info_t info,
                 cusparseSolvePolicy_t policy,
                 char *pBuffer);

```

This function performs the solve phase of the computing the incomplete-Cholesky factorization with 0 fill-in and no pivoting:

$$A \approx LL^H$$

This function requires a buffer size returned by `csric02_bufferSize()`. The address of `pBuffer` must be a multiple of 128 bytes. If not, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Although `csric02()` can be done without level information, the user still needs to be aware of consistency. If `csric02_analysis()` is called with policy `CUSPARSE_SOLVE_POLICY_USE_LEVEL`, `csric02()` can be run with or without levels. On the other hand, if `csric02_analysis()` is called with `CUSPARSE_SOLVE_POLICY_NO_LEVEL`, `csric02()` can only accept `CUSPARSE_SOLVE_POLICY_NO_LEVEL`; otherwise, `CUSPARSE_STATUS_INVALID_VALUE` is returned.

Function `csric02()` reports the first numerical zero, including a structural zero. The user must call `cusparsExcsric02_zeroPivot()` to know where the numerical zero is.

Function `csric02()` only takes the lower triangular part of matrix **A** to perform factorization. The matrix type must be `CUSPARSE_MATRIX_TYPE_GENERAL`, the fill mode and diagonal type are ignored, and the strictly upper triangular part is ignored and never touched. It does not matter if **A** is Hermitian or not. In other words, from the point of view of `csric02()` **A** is Hermitian and only the lower triangular part is provided.

In practice, a positive definite matrix may not have incomplete cholesky factorization. To the best of our knowledge, only matrix **M** can guarantee the existence of incomplete cholesky factorization. If `csric02()` failed cholesky factorization and reported a numerical zero, it is possible that incomplete cholesky factorization does not exist.

For example, suppose **A** is a real  $m \times m$  matrix, the following code solves the precondition system  $\mathbf{M} \cdot \mathbf{y} = \mathbf{x}$  where **M** is the product of Cholesky factorization **L** and its transpose.

$$M = LL^H$$

```

// Suppose that A is m x m sparse matrix represented by CSR format,
// Assumption:
// - handle is already created by cusparseCreate(),
// - (d_csrRowPtr, d_csrColInd, d_csrVal) is CSR of A on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory.
// - d_z is intermediate result on device memory.

cusparseMatDescr_t descr_M = 0;
cusparseMatDescr_t descr_L = 0;
csric02Info_t info_M = 0;
csrsv2Info_t info_L = 0;
csrsv2Info_t info_Lt = 0;
int pBufferSize_M;
int pBufferSize_L;
int pBufferSize_Lt;
int pBufferSize;
char *pBuffer = 0;
int structural_zero;
int numerical_zero;
const double alpha = 1.;
const cusparseSolvePolicy_t policy_M = CUSPARSE_SOLVE_POLICY_NO_LEVEL;
const cusparseSolvePolicy_t policy_L = CUSPARSE_SOLVE_POLICY_NO_LEVEL;
const cusparseSolvePolicy_t policy_Lt = CUSPARSE_SOLVE_POLICY_USE_LEVEL;
const cusparseOperation_t trans_L = CUSPARSE_OPERATION_NON_TRANSPOSE;
const cusparseOperation_t trans_Lt = CUSPARSE_OPERATION_TRANSPOSE;

// step 1: create a descriptor which contains
// - matrix M is base-1
// - matrix L is base-1
// - matrix L is lower triangular
// - matrix L has non-unit diagonal
cusparseCreateMatDescr(&descr_M);
cusparseSetMatIndexBase(descr_M, CUSPARSE_INDEX_BASE_ONE);

cusparseDcsrsv2_bufferSize(handle, trans_Lt, m, nnz,
    descr_L, d_csrVal, d_csrRowPtr, d_csrColInd, &pBufferSize_Lt);

pBufferSize = max(bufferSize_M, max(pBufferSize_L, pBufferSize_Lt));

// pBuffer returned by cudaMalloc is automatically aligned to 128 bytes.
cudaMalloc((void**)&pBuffer, pBufferSize);

// step 4: perform analysis of incomplete Cholesky on M
//         perform analysis of triangular solve on L
//         perform analysis of triangular solve on L'
// The lower triangular part of M has the same sparsity pattern as L, so
// we can do analysis of csric02 and csrsv2 simultaneously.

cusparseDcsric02_analysis(handle, m, nnz, descr_M,
    d_csrVal, d_csrRowPtr, d_csrColInd, info_M,
    policy_M, pBuffer);
status = cusparseXcsric02_zeroPivot(handle, info_M, &structural_zero);
if (CUSPARSE_STATUS_ZERO_PIVOT == status) {

```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzeros of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>csrValA_valM</b>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<b>policy</b>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<b>pBuffer</b>	buffer allocated by the user; the size is returned by <code>csric02_bufferSize()</code> .

## Output

<b>csrValA_valM</b>	<type> matrix containing the incomplete-Cholesky lower triangular factor.
---------------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt;= 0</code> ), base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 10.5. cusparseXcsric02\_zeroPivot()

```
cusparseStatus_t
cusparseXcsric02_zeroPivot(cusparseHandle_t handle,
                           csric02Info_t info,
                           int *position);
```

If the returned error code is **CUSPARSE\_STATUS\_ZERO\_PIVOT**, **position=j** means **A(j,j)** has either a structural zero or a numerical zero; otherwise, **position=-1**.

The **position** can be 0-based or 1-based, the same as the matrix.

Function **cusparseXcsric02\_zeroPivot()** is a blocking call. It calls **cudaDeviceSynchronize()** to make sure all previous kernels are done.

The **position** can be in the host memory or device memory. The user can set proper mode with **cusparseSetPointerMode()**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	<b>info</b> contains structural zero or numerical zero if the user already called <b>csric02_analysis()</b> or <b>csric02()</b> .

### Output

<b>position</b>	if no structural or numerical zero, <b>position</b> is -1; otherwise, if <b>A(j,j)</b> is missing or <b>L(j,j)</b> is zero, <b>position=j</b> .
-----------------	---

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	<b>info</b> is not valid.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

## 10.6. `cusparse<t>csrilu0()`

```

cusparseStatus_t
cusparseScsrilu0(cusparseHandle_t handle, cusparseOperation_t trans,
                 int m, const cusparseMatDescr_t descrA,
                 float *csrValM,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseDcsrilu0(cusparseHandle_t handle, cusparseOperation_t trans,
                 int m, const cusparseMatDescr_t descrA,
                 double *csrValM,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseCcsrilu0(cusparseHandle_t handle, cusparseOperation_t trans,
                 int m, const cusparseMatDescr_t descrA,
                 cuComplex *csrValM,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseSolveAnalysisInfo_t info)

cusparseStatus_t
cusparseZcsrilu0(cusparseHandle_t handle, cusparseOperation_t trans,
                 int m, const cusparseMatDescr_t descrA,
                 cuDoubleComplex *csrValM,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseSolveAnalysisInfo_t info)

```

This function computes the incomplete-LU factorization with 0 fill-in and no pivoting:

$$\text{op}(A) \approx LU$$

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValM**, **csrRowPtrA**, and **csrColIndA**; and

$$\text{op}(A) = \begin{cases} A & \text{if trans == CUSPARSE_OPERATION_NON_TRANSPOSE} \\ A^T & \text{if trans == CUSPARSE_OPERATION_TRANSPOSE} \\ A^H & \text{if trans == CUSPARSE_OPERATION_CONJUGATE_TRANSPOSE} \end{cases}$$

Notice that the diagonal of lower triangular factor  $L$  is unitary and need not be stored. Therefore, the input matrix is overwritten with the resulting lower and upper triangular factors  $L$  and  $U$ , respectively.

A call to this routine must be preceded by a call to the **csrsv\_analysis()** routine.

This function requires some extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>trans</b>	the operation $\text{op}(A)$ .
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are

	CUSPARSE_INDEX_BASE_ZERO and CUSPARSE_INDEX_BASE_ONE.
<code>csrValM</code>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<code>csrRowPtrA</code>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<code>csrColIndA</code>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<code>info</code>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).

## Output

<code>csrValM</code>	<type> matrix containing the incomplete-LU lower and upper triangular factors.
----------------------	--

## Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( <code>m &lt; 0</code> ).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 10.7. `cusparse<t>csrilu02_numericBoost()`

```

cusparseStatus_t
cusparseScsrilu02_numericBoost(cusparseHandle_t handle,
                               csrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               float *boost_val);

cusparseStatus_t
cusparseDcsrilu02_numericBoost(cusparseHandle_t handle,
                               csrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               double *boost_val);

cusparseStatus_t
cusparseCcsrilu02_numericBoost(cusparseHandle_t handle,
                               csrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               cuComplex *boost_val);

cusparseStatus_t
cusparseZcsrilu02_numericBoost(cusparseHandle_t handle,
                               csrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               cuDoubleComplex *boost_val);

```

The user can use a boost value to replace a numerical value in incomplete LU factorization. The **tol** is used to determine a numerical zero, and the **boost\_val** is used to replace a numerical zero. The behavior is

if **tol**  $\geq$  **fabs**(**A**(**j**,**j**)), then **A**(**j**,**j**)=**boost\_val**.

To enable a boost value, the user has to set parameter **enable\_boost** to 1 before calling **csrilu02()**. To disable a boost value, the user can call **csrilu02\_numericBoost()** again with parameter **enable\_boost=0**.

If **enable\_boost=0**, **tol** and **boost\_val** are ignored.

Both **tol** and **boost\_val** can be in the host memory or device memory. The user can set the proper mode with **cusparseSetPointerMode()**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	structure initialized using <b>cusparseCreateCsrilu02Info()</b> .
<b>enable_boost</b>	disable boost by <b>enable_boost=0</b> ; otherwise, boost is enabled.
<b>tol</b>	tolerance to determine a numerical zero.

<code>boost_val</code>	boost value to replace a numerical zero.
------------------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	<code>info</code> or pointer mode is not valid.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 10.8. `cusparse<t>csrilu02_bufferSize()`

```

cusparseStatus_t
cusparseScsrilu02_bufferSize(cusparseHandle_t handle,
                             int m,
                             int nnz,
                             const cusparseMatDescr_t descrA,
                             float *csrValA,
                             const int *csrRowPtrA,
                             const int *csrColIndA,
                             csrilu02Info_t info,
                             int *pBufferSize);

cusparseStatus_t
cusparseDcsrilu02_bufferSize(cusparseHandle_t handle,
                             int m,
                             int nnz,
                             const cusparseMatDescr_t descrA,
                             double *csrValA,
                             const int *csrRowPtrA,
                             const int *csrColIndA,
                             csrilu02Info_t info,
                             int *pBufferSize);

cusparseStatus_t
cusparseCcsrilu02_bufferSize(cusparseHandle_t handle,
                             int m,
                             int nnz,
                             const cusparseMatDescr_t descrA,
                             cuComplex *csrValA,
                             const int *csrRowPtrA,
                             const int *csrColIndA,
                             csrilu02Info_t info,
                             int *pBufferSize);

cusparseStatus_t
cusparseZcsrilu02_bufferSize(cusparseHandle_t handle,
                             int m,
                             int nnz,
                             const cusparseMatDescr_t descrA,
                             cuDoubleComplex *csrValA,
                             const int *csrRowPtrA,
                             const int *csrColIndA,
                             csrilu02Info_t info,
                             int *pBufferSize);

```

This function returns size of the buffer used in computing the incomplete-LU factorization with 0 fill-in and no pivoting:

$$A \approx LU$$

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**.

The buffer size depends on the dimension **m** and **nnz**, the number of nonzeros of the matrix. If the user changes the matrix, it is necessary to call **csrilu02\_bufferSize()** again to have the correct buffer size; otherwise, a segmentation fault may occur.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzeros of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of $m + 1$ elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) column indices of the nonzero elements of matrix <b>A</b> .

### Output

<b>info</b>	record internal states based on different algorithms.
<b>pBufferSize</b>	number of bytes of the buffer used in <b>csrilu02_analysis()</b> and <b>csrilu02()</b> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>nnz</b> $\leq 0$ ), base index is not 0 or 1.
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device only supports compute capability 2.0 and above.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 10.9. `cusparse<t>csrilu02_analysis()`

```

cusparseStatus_t
cusparseScsrilu02_analysis(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           const float *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrilu02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

cusparseStatus_t
cusparseDcsrilu02_analysis(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           const double *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrilu02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

cusparseStatus_t
cusparseCcsrilu02_analysis(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           const cuComplex *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrilu02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

cusparseStatus_t
cusparseZcsrilu02_analysis(cusparseHandle_t handle,
                           int m,
                           int nnz,
                           const cusparseMatDescr_t descrA,
                           const cuDoubleComplex *csrValA,
                           const int *csrRowPtrA,
                           const int *csrColIndA,
                           csrilu02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

```

This function performs the analysis phase of the incomplete-LU factorization with 0 fill-in and no pivoting:

$$A \approx LU$$

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**.

This function requires the buffer size returned by **csrilu02\_bufferSize()**. The address of **pBuffer** must be a multiple of 128 bytes. If not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **csrilu02\_analysis()** reports a structural zero and computes level information stored in the opaque structure **info**. The level information can extract more parallelism during incomplete LU factorization; however **csrilu02()** can be done without level information. To disable level information, the user must specify the policy of **csrilu02()** as **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**.

It is the user's choice whether to call **csrilu02()** if **csrilu02\_analysis()** reports a structural zero. In this case, the user can still call **csrilu02()**, which will return a numerical zero at the same position as the structural zero. However the result is meaningless.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzeros of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of $m + 1$ elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> ( $= \text{csrRowPtrA}(m) - \text{csrRowPtrA}(0)$ ) column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure initialized using <b>cusparseCreateCsrilu02Info()</b> .
<b>policy</b>	the supported policies are <b>CUSPARSE_SOLVE_POLICY_NO_LEVEL</b> and <b>CUSPARSE_SOLVE_POLICY_USE_LEVEL</b> .
<b>pBuffer</b>	buffer allocated by the user, the size is returned by <b>csrilu02_bufferSize()</b> .

### Output

<b>info</b>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------	---

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( $m, nnz \leq 0$ ), base index is not 0 or 1.
CUSPARSE_STATUS_ARCH_MISMATCH	the device only supports compute capability 2.0 and above.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 10.10. cusparse<t>csrilu02()

```

cusparseStatus_t
cusparseScsrilu02(cusparseHandle_t handle,
                  int m,

                  double *csrValA_valM,
                  const int *csrRowPtrA,
                  const int *csrColIndA,
                  csrilu02Info_t info,
                  cusparseSolvePolicy_t policy,
                  char *pBuffer);

cusparseStatus_t
cusparseCcsrilu02(cusparseHandle_t handle,
                  int m,
                  int nnz,
                  const cusparseMatDescr_t descrA,
                  cuComplex *csrValA_valM,
                  const int *csrRowPtrA,
                  const int *csrColIndA,
                  csrilu02Info_t info,
                  cusparseSolvePolicy_t policy,
                  char *pBuffer);

cusparseStatus_t
cusparseZcsrilu02(cusparseHandle_t handle,
                  int m,
                  int nnz,
                  const cusparseMatDescr_t descrA,
                  cuDoubleComplex *csrValA_valM,
                  const int *csrRowPtrA,
                  const int *csrColIndA,
                  csrilu02Info_t info,
                  cusparseSolvePolicy_t policy,
                  char *pBuffer);

```

This function performs the solve phase of the incomplete-LU factorization with 0 fill-in and no pivoting:

$$A \approx LU$$

**A** is an  $m \times m$  sparse matrix that is defined in CSR storage format by the three arrays **csrValA\_valM**, **csrRowPtrA**, and **csrColIndA**.

This function requires a buffer size returned by **csrilu02\_bufferSize()**. The address of **pBuffer** must be a multiple of 128 bytes. If not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**. The fill mode and diagonal type are ignored.

Although **csrilu02()** can be done without level information, the user still needs to be aware of consistency. If **csrilu02\_analysis()** is called with policy **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**, **csrilu02()** can be run with or without levels. On the other hand, if **csrilu02\_analysis()** is called with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**, **csrilu02()** can only accept **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**; otherwise, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **csrilu02()** reports the first numerical zero, including a structural zero. The user must call **cusparseXcsrilu02\_zeroPivot()** to know where the numerical zero is.

For example, suppose  $\mathbf{A}$  is a real  $m \times m$  matrix, the following code solves precondition system  $\mathbf{M}\mathbf{y} = \mathbf{x}$  where  $\mathbf{M}$  is the product of LU factors  $\mathbf{L}$  and  $\mathbf{U}$ .

```
// Suppose that A is m x m sparse matrix represented by CSR format,
// Assumption:
// - handle is already created by cusparseCreate(),
// - (d_csrRowPtr, d_csrColInd, d_csrVal) is CSR of A on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory.
// - d_z is intermediate result on device memory.

cusparseMatDescr_t descr_M = 0;
cusparseMatDescr_t descr_L = 0;
cusparseMatDescr_t descr_U = 0;
csrilu02Info_t info_M = 0;
csrsv2Info_t info_L = 0;

cusparseDcsrsv2_bufferSize(handle, trans_U, m, nnz,
    descr_U, d_csrVal, d_csrRowPtr, d_csrColInd, &pBufferSize_U);

pBufferSize = max(pBufferSize_M, max(pBufferSize_L, pBufferSize_U));

// pBuffer returned by cudaMalloc is automatically aligned to 128 bytes.
cudaMalloc((void**) &pBuffer, pBufferSize);

// step 4: perform analysis of incomplete Cholesky on M
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows and columns of matrix <b>A</b> .
<b>nnz</b>	number of nonzeros of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>csrValA_valM</b>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <code>m + 1</code> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <b>A</b> .
<b>info</b>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<b>policy</b>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<b>pBuffer</b>	buffer allocated by the user; the size is returned by <code>csrilu02_bufferSize()</code> .

## Output

<b>csrValA_valM</b>	<type> matrix containing the incomplete-LU lower and upper triangular factors.
---------------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, nnz &lt;= 0</code> ), base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 10.11. cusparseXcsrilu02\_zeroPivot()

```
cusparseStatus_t
cusparseXcsrilu02_zeroPivot(cusparseHandle_t handle,
                           csrilu02Info_t info,
                           int *position);
```

If the returned error code is **CUSPARSE\_STATUS\_ZERO\_PIVOT**, **position=j** means **A(j,j)** has either a structural zero or a numerical zero; otherwise, **position=-1**.

The **position** can be 0-based or 1-based, the same as the matrix.

Function **cusparseXcsrilu02\_zeroPivot()** is a blocking call. It calls **cudaDeviceSynchronize()** to make sure all previous kernels are done.

The **position** can be in the host memory or device memory. The user can set proper mode with **cusparseSetPointerMode()**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	<b>info</b> contains structural zero or numerical zero if the user already called <b>csrilu02_analysis()</b> or <b>csrilu02()</b> .

### Output

<b>position</b>	if no structural or numerical zero, <b>position</b> is -1; otherwise if <b>A(j,j)</b> is missing or <b>U(j,j)</b> is zero, <b>position=j</b> .
-----------------	--

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	<b>info</b> is not valid.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

## 10.12. `cusparse<t>bsric02_bufferSize()`

```

cusparseStatus_t
cusparseSbsric02_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           float *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseDbsric02_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           double *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseCbsric02_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           cuComplex *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           int *pBufferSize);

cusparseStatus_t
cusparseZbsric02_bufferSize(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           cuDoubleComplex *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           int *pBufferSize);

```

This function returns the size of a buffer used in computing the incomplete-Cholesky factorization with 0 fill-in and no pivoting

$$A \approx LL^H$$

**A** is an **(mb\*blockDim) \* (mb\*blockDim)** sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**.

The buffer size depends on the dimensions of **mb**, **blockDim**, and the number of nonzero blocks of the matrix **nnzb**. If the user changes the matrix, it is necessary to call **bsric02\_bufferSize()** again to have the correct buffer size; otherwise, a segmentation fault may occur.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>mb</b>	number of block rows and block columns of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>bsrValA</b>	<type> array of <b>nnzb</b> ( = <b>bsrRowPtrA</b> ( <b>mb</b> ) - <b>bsrRowPtrA</b> (0) ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <b>mb</b> + 1 elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <b>nnzb</b> ( = <b>bsrRowPtrA</b> ( <b>mb</b> ) - <b>bsrRowPtrA</b> (0) ) column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> , larger than zero.

### Output

<b>info</b>	record internal states based on different algorithms.
<b>pBufferSize</b>	number of bytes of the buffer used in <b>bsric02_analysis()</b> and <b>bsric02()</b> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>mb</b> , <b>nnzb</b> ≤ 0); the base index is not 0 or 1.

CUSPARSE_STATUS_ARCH_MISMATCH	the device only supports compute capability 2.0 and above.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 10.13. cusparse<t>bsric02\_analysis()

```

cusparseStatus_t
cusparseSbsric02_analysis(cusparseHandle_t handle,
                          cusparseDirection_t dirA,
                          int mb,
                          int nnzb,
                          const cusparseMatDescr_t descrA,
                          const float *bsrValA,
                          const int *bsrRowPtrA,
                          const int *bsrColIndA,
                          int blockDim,
                          bsric02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);

cusparseStatus_t
cusparseDbbsric02_analysis(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           const double *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

cusparseStatus_t
cusparseCbsric02_analysis(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           const cuComplex *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

cusparseStatus_t
cusparseZbsric02_analysis(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           const cuDoubleComplex *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsric02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);

```

This function performs the analysis phase of the incomplete-Cholesky factorization with 0 fill-in and no pivoting

$$A \approx LL^H$$

**A** is an **(mb\*blockDim) x (mb\*blockDim)** sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**. The block in BSR format is of size **blockDim\*blockDim**, stored as column-major or row-major as determined by parameter **dirA**, which is either **CUSPARSE\_DIRECTION\_COLUMN** or **CUSPARSE\_DIRECTION\_ROW**. The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**, and the fill mode and diagonal type are ignored.

This function requires a buffer size returned by **bsric02\_bufferSize90**.

The address of **pBuffer** must be a multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **bsric02\_analysis()** reports structural zero and computes level information stored in the opaque structure **info**. The level information can extract more parallelism during incomplete Cholesky factorization. However **bsric02()** can be done without level information. To disable level information, the user needs to specify the parameter **policy** of **bsric02[\_analysis| ]** as **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**.

Function **bsric02\_analysis** always reports the first structural zero, even when parameter **policy** is **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**. The user must call **cusparseXbsric02\_zeroPivot()** to know where the structural zero is.

It is the user's choice whether to call **bsric02()** if **bsric02\_analysis()** reports a structural zero. In this case, the user can still call **bsric02()**, which returns a numerical zero in the same position as the structural zero. However the result is meaningless.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>mb</b>	number of block rows and block columns of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>bsrValA</b>	<type> array of <b>nnzb</b> (= <b>bsrRowPtrA</b> ( <b>mb</b> ) - <b>bsrRowPtrA</b> (0) ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <b>mb</b> + 1 elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <b>nnzb</b> (= <b>bsrRowPtrA</b> ( <b>mb</b> ) - <b>bsrRowPtrA</b> (0) ) column indices of the nonzero blocks of matrix <b>A</b> .

<b>blockDim</b>	block dimension of sparse matrix A; must be larger than zero.
<b>info</b>	structure initialized using <code>cusparseCreateBsrict02Info()</code> .
<b>policy</b>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<b>pBuffer</b>	buffer allocated by the user; the size is returned by <code>bsrict02_bufferSize()</code> .

## Output

<b>info</b>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nnzb &lt;= 0</code> ); the base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 10.14. `cusparse<t>bsric02()`

```

cusparseStatus_t
cusparseSbsric02(cusparseHandle_t handle,
                 cusparseDirection_t dirA,

                 int blockDim,
                 bsric02Info_t info,
                 cusparseSolvePolicy_t policy,
                 char *pBuffer);

```

This function performs the solve phase of the incomplete-Cholesky factorization with 0 fill-in and no pivoting

$$A \approx LL^H$$

**A** is an  $(mb \times blockDim) \times (mb \times blockDim)$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**. The block in BSR format is of size  $blockDim \times blockDim$ , stored as column-major or row-major as determined by parameter **dirA**, which is either **CUSPARSE\_DIRECTION\_COLUMN** or **CUSPARSE\_DIRECTION\_ROW**. The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**, and the fill mode and diagonal type are ignored.

This function requires a buffer size returned by **bsric02\_bufferSize()**. The address of **pBuffer** must be a multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Although **bsric02()** can be done without level information, the user must be aware of consistency. If **bsric02\_analysis()** is called with policy **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**, **bsric02()** can be run with or without levels. On the other hand, if **bsric02\_analysis()** is called with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**, **bsric02()** can only accept **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**; otherwise, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **bsric02()** has the same behavior as **csric02()**. That is, **bsr2csr(bsric02(A)) = csric02(bsr2csr(A))**. The numerical zero of **csric02()** means there exists some zero  $L(j, j)$ . The numerical zero of **bsric02()** means there exists some block  $L_j, j$  that is not invertible.

Function **bsric02** reports the first numerical zero, including a structural zero. The user must call **cusparsExbsric02\_zeroPivot()** to know where the numerical zero is.

The **bsric02()** function only takes the lower triangular part of matrix **A** to perform factorization. The strictly upper triangular part is ignored and never touched. It does not matter if **A** is Hermitian or not. In other words, from the point of view of **bsric02()**, **A** is Hermitian and only the lower triangular part is provided. Moreover, the imaginary part of diagonal elements of diagonal blocks is ignored.

For example, suppose **A** is a real  $m$ -by- $m$  matrix, where  $m = mb \times blockDim$ . The following code solves precondition system  $M \cdot y = x$ , where **M** is the product of Cholesky factorization **L** and its transpose.

$$M = LL^H$$

```

// Suppose that A is m x m sparse matrix represented by BSR format,
// The number of block rows/columns is mb, and
// the number of nonzero blocks is nnzb.
// Assumption:
// - handle is already created by cusparseCreate(),
// - (d_bsrRowPtr, d_bsrColInd, d_bsrVal) is BSR of A on device memory,
// - d_x is right hand side vector on device memory,
// - d_y is solution vector on device memory.
// - d_z is intermediate result on device memory.
// - d_x, d_y and d_z are of size m.

//         perform analysis of triangular solve on L
//         perform analysis of triangular solve on L'
// The lower triangular part of M has the same sparsity pattern as L, so
// we can do analysis of bsric02 and bsrsv2 simultaneously.
cusparseDbbsric02_analysis(handle, dir, mb, nnzb, descr_M,

```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>mb</b>	number of block rows and block columns of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>bsrValA</b>	<type> array of <code>nnzb</code> ( <code>= bsrRowPtrA(mb) - bsrRowPtrA(0)</code> ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <code>mb + 1</code> elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <code>nnzb</code> ( <code>= bsrRowPtrA(mb) - bsrRowPtrA(0)</code> ) column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> , larger than zero.
<b>info</b>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<b>policy</b>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<b>pBuffer</b>	buffer allocated by the user, the size is returned by <code>bsric02_bufferSize()</code> .

## Output

<b>bsrValA</b>	<type> matrix containing the incomplete-Cholesky lower triangular factor.
----------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nnzb &lt;= 0</code> ); the base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code> the matrix type is not supported.
--

## 10.15. `cusparseXbsric02_zeroPivot()`

```
cusparseStatus_t
cusparseXbsric02_zeroPivot(cusparseHandle_t handle,
                           bsr02Info_t info,
                           int *position);
```

If the returned error code is `CUSPARSE_STATUS_ZERO_PIVOT`, `position=j` means  $A(j, j)$  has either a structural zero or a numerical zero (the block is not positive definite). Otherwise `position=-1`.

The `position` can be 0-based or 1-based, the same as the matrix.

Function `cusparseXbsric02_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.

The `position` can be in the host memory or device memory. The user can set the proper mode with `cusparseSetPointerMode()`.

### Input

<code>handle</code>	handle to the cuSPARSE library context.
<code>info</code>	<code>info</code> contains a structural zero or a numerical zero if the user already called <code>bsric02_analysis()</code> or <code>bsric02()</code> .

### Output

<code>position</code>	if no structural or numerical zero, <code>position</code> is -1, otherwise if $A(j, j)$ is missing or $L(j, j)$ is not positive definite, <code>position=j</code> .
-----------------------	---

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	<code>info</code> is not valid.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 10.16. cusparse<t>bsrilu02\_numericBoost()

```

cusparseStatus_t
cusparseSbsrilu02_numericBoost(cusparseHandle_t handle,
                               bsrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               float *boost_val);

cusparseStatus_t
cusparseDbbsrilu02_numericBoost(cusparseHandle_t handle,
                                bsrilu02Info_t info,
                                int enable_boost,
                                double *tol,
                                double *boost_val);

cusparseStatus_t
cusparseCbsrilu02_numericBoost(cusparseHandle_t handle,
                               bsrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               cuComplex *boost_val);

cusparseStatus_t
cusparseZbsrilu02_numericBoost(cusparseHandle_t handle,
                               bsrilu02Info_t info,
                               int enable_boost,
                               double *tol,
                               cuDoubleComplex *boost_val);

```

The user can use a boost value to replace a numerical value in incomplete LU factorization. Parameter **tol** is used to determine a numerical zero, and **boost\_val** is used to replace a numerical zero. The behavior is as follows:

if **tol**  $\geq$  **fabs**(**A**(**j**,**j**)), then reset each diagonal element of block **A**(**j**,**j**) by **boost\_val**.

To enable a boost value, the user sets parameter **enable\_boost** to 1 before calling **bsrilu02()**. To disable the boost value, the user can call **bsrilu02\_numericBoost()** with parameter **enable\_boost=0**.

If **enable\_boost=0**, **tol** and **boost\_val** are ignored.

Both **tol** and **boost\_val** can be in host memory or device memory. The user can set the proper mode with **cusparseSetPointerMode()**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	structure initialized using <b>cusparseCreateBsrilu02Info()</b> .
<b>enable_boost</b>	disable boost by setting <b>enable_boost=0</b> . Otherwise, boost is enabled.

<code>tol</code>	tolerance to determine a numerical zero.
<code>boost_val</code>	boost value to replace a numerical zero.

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	<code>info</code> or pointer mode is not valid.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 10.17. `cusparse<t>bsrilu02_bufferSize()`

```

cusparseStatus_t
cusparseSbsrilu02_bufferSize(cusparseHandle_t handle,
                             cusparseDirection_t dirA,
                             int mb,
                             int nnzb,
                             const cusparseMatDescr_t descrA,
                             float *bsrValA,
                             const int *bsrRowPtrA,
                             const int *bsrColIndA,
                             int blockDim,
                             bsrilu02Info_t info,
                             int *pBufferSize);

cusparseStatus_t
cusparseDbbsrilu02_bufferSize(cusparseHandle_t handle,
                              cusparseDirection_t dirA,
                              int mb,
                              int nnzb,
                              const cusparseMatDescr_t descrA,
                              double *bsrValA,
                              const int *bsrRowPtrA,
                              const int *bsrColIndA,
                              int blockDim,
                              bsrilu02Info_t info,
                              int *pBufferSize);

cusparseStatus_t
cusparseCbsrilu02_bufferSize(cusparseHandle_t handle,
                             cusparseDirection_t dirA,
                             int mb,
                             int nnzb,
                             const cusparseMatDescr_t descrA,
                             cuComplex *bsrValA,
                             const int *bsrRowPtrA,
                             const int *bsrColIndA,
                             int blockDim,
                             bsrilu02Info_t info,
                             int *pBufferSize);

cusparseStatus_t
cusparseZbsrilu02_bufferSize(cusparseHandle_t handle,
                              cusparseDirection_t dirA,
                              int mb,
                              int nnzb,
                              const cusparseMatDescr_t descrA,
                              cuDoubleComplex *bsrValA,
                              const int *bsrRowPtrA,
                              const int *bsrColIndA,
                              int blockDim,
                              bsrilu02Info_t info,
                              int *pBufferSize);

```

This function returns the size of the buffer used in computing the incomplete-LU factorization with 0 fill-in and no pivoting

$$A \approx LU$$

**A** is an  $(\text{mb} * \text{blockDim}) * (\text{mb} * \text{blockDim})$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**.

The buffer size depends on the dimensions of **mb**, **blockDim**, and the number of nonzero blocks of the matrix **nnzb**. If the user changes the matrix, it is necessary to call **bsrilu02\_bufferSize()** again to have the correct buffer size; otherwise, a segmentation fault may occur.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>mb</b>	number of block rows and columns of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>bsrValA</b>	<type> array of <b>nnzb</b> ( $= \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0)$ ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <b>mb</b> + 1 elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <b>nnzb</b> ( $= \text{bsrRowPtrA}(\text{mb}) - \text{bsrRowPtrA}(0)$ ) column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> , larger than zero.

### Output

<b>info</b>	record internal states based on different algorithms.
<b>pBufferSize</b>	number of bytes of the buffer used in <b>bsrilu02_analysis()</b> and <b>bsrilu02()</b> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>mb</b> , <b>nnzb</b> ≤ 0), base index is not 0 or 1.

CUSPARSE_STATUS_ARCH_MISMATCH	the device only supports compute capability 2.0 and above.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 10.18. cusparse<t>bsrilu02\_analysis()

```
cusparseStatus_t
cusparseSbsrilu02_analysis(cusparseHandle_t handle,
                          cusparseDirection_t dirA,
                          int mb,
                          int nnzb,
                          const cusparseMatDescr_t descrA,
                          float *bsrValA,
                          const int *bsrRowPtrA,
                          const int *bsrColIndA,
                          int blockDim,
                          bsrilu02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);
```

```
cusparseStatus_t
cusparseDbbsrilu02_analysis(cusparseHandle_t handle,
                           cusparseDirection_t dirA,
                           int mb,
                           int nnzb,
                           const cusparseMatDescr_t descrA,
                           double *bsrValA,
                           const int *bsrRowPtrA,
                           const int *bsrColIndA,
                           int blockDim,
                           bsrilu02Info_t info,
                           cusparseSolvePolicy_t policy,
                           char *pBuffer);
```

```
cusparseStatus_t
cusparseCbsrilu02_analysis(cusparseHandle_t handle,
                          cusparseDirection_t dirA,
                          int mb,
                          int nnzb,
                          const cusparseMatDescr_t descrA,
                          cuComplex *bsrValA,
                          const int *bsrRowPtrA,
                          const int *bsrColIndA,
                          int blockDim,
                          bsrilu02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);
```

```
cusparseStatus_t
cusparseZbsrilu02_analysis(cusparseHandle_t handle,
                          cusparseDirection_t dirA,
                          int mb,
                          int nnzb,
                          const cusparseMatDescr_t descrA,
                          cuDoubleComplex *bsrValA,
                          const int *bsrRowPtrA,
                          const int *bsrColIndA,
                          int blockDim,
                          bsrilu02Info_t info,
                          cusparseSolvePolicy_t policy,
                          char *pBuffer);
```

This function performs the analysis phase of the incomplete-LU factorization with 0 fill-in and no pivoting

$$A \approx LU$$

**A** is an  $(mb \times blockDim) \times (mb \times blockDim)$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**. The block in BSR format is of size **blockDim\*blockDim**, stored as column-major or row-major as determined by parameter **dirA**, which is either **CUSPARSE\_DIRECTION\_COLUMN** or **CUSPARSE\_DIRECTION\_ROW**. The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**, and the fill mode and diagonal type are ignored.

This function requires a buffer size returned by **bsrilu02\_bufferSize()**. The address of **pBuffer** must be multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **bsrilu02\_analysis()** reports a structural zero and computes level information stored in the opaque structure **info**. The level information can extract more parallelism during incomplete LU factorization. However **bsrilu02()** can be done without level information. To disable level information, the user needs to specify the parameter **policy** of **bsrilu02[\_analysis| ]** as **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**.

Function **bsrilu02\_analysis()** always reports the first structural zero, even with parameter **policy** is **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**. The user must call **cusparsExbsrilu02\_zeroPivot()** to know where the structural zero is.

It is the user's choice whether to call **bsrilu02()** if **bsrilu02\_analysis()** reports a structural zero. In this case, the user can still call **bsrilu02()**, which will return a numerical zero at the same position as the structural zero. However the result is meaningless.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>mb</b>	number of block rows and block columns of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>bsrValA</b>	<type> array of <b>nnzb</b> (= <b>bsrRowPtrA</b> ( <b>mb</b> ) - <b>bsrRowPtrA</b> (0) ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <b>mb</b> + 1 elements that contains the start of every block row and the end of the last block row plus one.

<code>bsrColIndA</code>	integer array of <code>nnzb</code> ( <code>= bsrRowPtrA(mb) - bsrRowPtrA(0)</code> ) column indices of the nonzero blocks of matrix <b>A</b> .
<code>blockDim</code>	block dimension of sparse matrix <b>A</b> , larger than zero.
<code>info</code>	structure initialized using <code>cusparseCreateBsrilu02Info()</code> .
<code>policy</code>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<code>pBuffer</code>	buffer allocated by the user, the size is returned by <code>bsrilu02_bufferSize()</code> .

## Output

<code>info</code>	structure filled with information collected during the analysis phase (that should be passed to the solve phase unchanged).
-------------------	---

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nnzb &lt;= 0</code> ); the base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 10.19. `cusparse<t>bsrilu02()`

```

cusparseStatus_t
cusparseSbsrilu02(cusparseHandle_t handle,
                  cusparseDirection_t dirA,
                  int mb,

                  const int *bsrColIndA,
                  int blockDim,
                  bsrilu02Info_t info,
                  cusparseSolvePolicy_t policy,
                  char *pBuffer);

```

This function performs the solve phase of the incomplete-LU factorization with 0 fill-in and no pivoting

$$A \approx LU$$

**A** is an  $(mb \times blockDim) \times (mb \times blockDim)$  sparse matrix that is defined in BSR storage format by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**. The block in BSR format is of size **blockDim** $\times$ **blockDim**, stored as column-major or row-major determined by parameter **dirA**, which is either **CUSPARSE\_DIRECTION\_COLUMN** or **CUSPARSE\_DIRECTION\_ROW**. The matrix type must be **CUSPARSE\_MATRIX\_TYPE\_GENERAL**, and the fill mode and diagonal type are ignored. Function **bsrilu02()** supports an arbitrary **blockDim**.

This function requires a buffer size returned by **bsrilu02\_bufferSize()**. The address of **pBuffer** must be a multiple of 128 bytes. If it is not, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Although **bsrilu02()** can be used without level information, the user must be aware of consistency. If **bsrilu02\_analysis()** is called with policy **CUSPARSE\_SOLVE\_POLICY\_USE\_LEVEL**, **bsrilu02()** can be run with or without levels. On the other hand, if **bsrilu02\_analysis()** is called with **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**, **bsrilu02()** can only accept **CUSPARSE\_SOLVE\_POLICY\_NO\_LEVEL**; otherwise, **CUSPARSE\_STATUS\_INVALID\_VALUE** is returned.

Function **bsrilu02()** has the same behavior as **csrilu02()**. That is, **bsr2csr(bsrilu02(A)) = csrilu02(bsr2csr(A))**. The numerical zero of **csrilu02()** means there exists some zero **U(j, j)**. The numerical zero of **bsrilu02()** means there exists some block **U(j, j)** that is not invertible.

Function **bsrilu02** reports the first numerical zero, including a structural zero. The user must call **cusparseXbsrilu02\_zeroPivot()** to know where the numerical zero is.

For example, suppose **A** is a real  $m$ -by- $m$  matrix where  $m = mb \cdot blockDim$ . The following code solves precondition system  $\mathbf{M} \cdot \mathbf{y} = \mathbf{x}$ , where  $\mathbf{M}$  is the product of LU factors  $\mathbf{L}$  and  $\mathbf{U}$ .

```
// Suppose that A is m x m sparse matrix represented by BSR format,
// The number of block rows/columns is mb, and
// the number of nonzero blocks is nnzb.
// Assumption:
// - handle is already created by cusparseCreate(),
// - (d_bsrRowPtr, d_bsrColInd, d_bsrVal) is BSR of A on device memory,
// - d_x is right hand side vector on device memory.
// - d_y is solution vector on device memory.
// - d_z is intermediate result on device memory.
// - d_x, d_y and d_z are of size m.
cusparseMatDescr_t descr_M = 0;

cusparseCreateBsrilu02Info(&info_M);
cusparseCreateBsrsv2Info(&info_L);
cusparseCreateBsrsv2Info(&info_U);

// step 3: query how much memory used in bsrilu02 and bsrsv2, and allocate the
// buffer
cusparseDbbsrilu02_bufferSize(handle, dir, mb, nnzb,
    descr_M, d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, &pBufferSize_M);
cusparseDbbsrsv2_bufferSize(handle, dir, trans_L, mb, nnzb,
    descr_L, d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, &pBufferSize_L);
cusparseDbbsrsv2_bufferSize(handle, dir, trans_U, mb, nnzb,
    descr_U, d_bsrVal, d_bsrRowPtr, d_bsrColInd, blockDim, &pBufferSize_U);

pBufferSize = max(pBufferSize_M, max(pBufferSize_L, pBufferSize_U));
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	storage format of blocks: either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>mb</b>	number of block rows and block columns of matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>bsrValA</b>	<type> array of <code>nnzb</code> ( <code>= bsrRowPtrA(mb) - bsrRowPtrA(0)</code> ) nonzero blocks of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <code>mb + 1</code> elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColIndA</b>	integer array of <code>nnzb</code> ( <code>= bsrRowPtrA(mb) - bsrRowPtrA(0)</code> ) column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> ; must be larger than zero.
<b>info</b>	structure with information collected during the analysis phase (that should have been passed to the solve phase unchanged).
<b>policy</b>	the supported policies are <code>CUSPARSE_SOLVE_POLICY_NO_LEVEL</code> and <code>CUSPARSE_SOLVE_POLICY_USE_LEVEL</code> .
<b>pBuffer</b>	buffer allocated by the user; the size is returned by <code>bsrilu02_bufferSize()</code> .

## Output

<b>bsrValA</b>	<type> matrix containing the incomplete-LU lower and upper triangular factors.
----------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nnzb &lt;= 0</code> ); the base index is not 0 or 1.
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device only supports compute capability 2.0 and above.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code> the matrix type is not supported.
--

## 10.20. `cusparseXbsrilu02_zeroPivot()`

```
cusparseStatus_t
cusparseXbsrilu02_zeroPivot(cusparseHandle_t handle,
                           bsrilu02Info_t info,
                           int *position);
```

If the returned error code is `CUSPARSE_STATUS_ZERO_PIVOT`, **position=j** means  $A(j, j)$  has either a structural zero or a numerical zero (the block is not invertible). Otherwise **position=-1**.

The **position** can be 0-based or 1-based, the same as the matrix.

Function `cusparseXbsrilu02_zeroPivot()` is a blocking call. It calls `cudaDeviceSynchronize()` to make sure all previous kernels are done.

The **position** can be in the host memory or device memory. The user can set proper the mode with `cusparseSetPointerMode()`.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>info</b>	<b>info</b> contains structural zero or numerical zero if the user already called <code>bsrilu02_analysis()</code> or <code>bsrilu02()</code> .

### Output

<b>position</b>	if no structural or numerical zero, <b>position</b> is -1; otherwise if $A(j, j)$ is missing or $U(j, j)$ is not invertible, <b>position=j</b> .
-----------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	<b>info</b> is not valid.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 10.21. cusparse<t>gtsv()

```

cusparseStatus_t
cusparseSgtsv(cusparseHandle_t handle, int m, int n,
              const float *dl, const float *d,
              const float *du, float *B, int ldb)

cusparseStatus_t
cusparseDgtsv(cusparseHandle_t handle, int m, int n,
              const double *dl, const double *d,
              const double *du, double *B, int ldb)

cusparseStatus_t
cusparseCgtsv(cusparseHandle_t handle, int m, int n,
              const cuComplex *dl, const cuComplex *d,
              const cuComplex *du, cuComplex *B, int ldb)

cusparseStatus_t
cusparseZgtsv(cusparseHandle_t handle, int m, int n,
              const cuDoubleComplex *dl, const cuDoubleComplex *d,
              const cuDoubleComplex *du, cuDoubleComplex *B, int ldb)

```

This function computes the solution of a tridiagonal linear system with multiple right-hand sides:

$$\mathbf{A} * \mathbf{Y} = \alpha * \mathbf{X}$$

The coefficient matrix **A** of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower (**dl**), main (**d**), and upper (**du**) matrix diagonals; the right-hand sides are stored in the dense matrix **X**. Notice that solution **Y** overwrites right-hand-side matrix **X** on exit.

The routine does perform pivoting, which usually results in more accurate and more stable results than **cusparse<t>gtsv\_nopivot()** at the expense of some execution time

This routine requires significant amount of temporary extra storage (**min(m, 8) \* (3+n) \* sizeof(<type>)**). It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	the size of the linear system (must be $\geq 3$ ).
<b>n</b>	number of right-hand sides, columns of matrix <b>B</b> .
<b>dl</b>	<type> dense array containing the lower diagonal of the tri-diagonal linear system. The first element of each lower diagonal must be zero.
<b>d</b>	<type> dense array containing the main diagonal of the tri-diagonal linear system.
<b>du</b>	<type> dense array containing the upper diagonal of the tri-diagonal linear system. The last element of each upper diagonal must be zero.

<b>B</b>	<type> dense right-hand-side array of dimensions (ldb, n).
<b>ldb</b>	leading dimension of <b>B</b> (that is $\geq \max(1, m)$ ).

### Output

<b>B</b>	<type> dense solution array of dimensions (ldb, n).
----------	---

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( $m < 3$ , $n < 0$ ).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 10.22. cusparse<t>gtsv\_nopivot()

```

cusparseStatus_t
cusparseSgtsv_nopivot(cusparseHandle_t handle, int m, int n,
    const float *dl, const float *d,
    const float *du, float *B, int ldb)

cusparseStatus_t
cusparseDgtsv_nopivot(cusparseHandle_t handle, int m, int n,
    const double *dl, const double *d,
    const double *du, double *B, int ldb)

cusparseStatus_t
cusparseCgtsv_nopivot(cusparseHandle_t handle, int m, int n,
    const cuComplex *dl, const cuComplex *d,
    const cuComplex *du, cuComplex *B, int ldb)

cusparseStatus_t
cusparseZgtsv_nopivot(cusparseHandle_t handle, int m, int n,
    const cuDoubleComplex *dl, const cuDoubleComplex *d,
    const cuDoubleComplex *du, cuDoubleComplex *B, int ldb)

```

This function computes the solution of a tridiagonal linear system with multiple right-hand sides:

$$A * Y = \alpha * X$$

The coefficient matrix **A** of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower (**dl**), main (**d**), and upper (**du**) matrix diagonals; the right-hand sides are stored in the dense matrix **x**. Notice that solution **y** overwrites right-hand-side matrix **x** on exit.

The routine does not perform any pivoting and uses a combination of the Cyclic Reduction (CR) and the Parallel Cyclic Reduction (PCR) algorithms to find the solution. It achieves better performance when **m** is a power of 2.

This routine requires a significant amount of temporary extra storage ( $m \times (3+n) \times \text{sizeof}(\text{<type>})$ ). It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	the size of the linear system (must be $\geq 3$ ).
<b>n</b>	number of right-hand sides, columns of matrix <b>B</b> .
<b>dl</b>	<type> dense array containing the lower diagonal of the tri-diagonal linear system. The first element of each lower diagonal must be zero.
<b>d</b>	<type> dense array containing the main diagonal of the tri-diagonal linear system.
<b>du</b>	<type> dense array containing the upper diagonal of the tri-diagonal linear system. The last element of each upper diagonal must be zero.
<b>B</b>	<type> dense right-hand-side array of dimensions ( <b>ldb</b> , <b>n</b> ).
<b>ldb</b>	leading dimension of <b>B</b> . (that is $\geq \max(1, m)$ ).

### Output

<b>B</b>	<type> dense solution array of dimensions ( <b>ldb</b> , <b>n</b> ).
----------	--

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( $m < 3$ , $n < 0$ ).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 10.23. cusparse<t>gtsvStridedBatch()

```

cusparseStatus_t
cusparseSgtsvStridedBatch(cusparseHandle_t handle, int m,
                          const float          *dl,
                          const float          *d,
                          const float          *du, float          *x,
                          int batchCount, int batchStride)

cusparseStatus_t
cusparseDgtsvStridedBatch(cusparseHandle_t handle, int m,
                          const double         *dl,
                          const double         *d,
                          const double         *du, double        *x,
                          int batchCount, int batchStride)

cusparseStatus_t
cusparseCgtsvStridedBatch(cusparseHandle_t handle, int m,
                          const cuComplex      *dl,
                          const cuComplex      *d,
                          const cuComplex      *du, cuComplex      *x,
                          int batchCount, int batchStride)

cusparseStatus_t
cusparseZgtsvStridedBatch(cusparseHandle_t handle, int m,
                          const cuDoubleComplex *dl,
                          const cuDoubleComplex *d,
                          const cuDoubleComplex *du, cuDoubleComplex *x,
                          int batchCount, int batchStride)

```

This function computes the solution of multiple tridiagonal linear systems for  $i=0, \dots, \text{batchCount}$ :

$$A^{(i)} * y^{(i)} = \alpha * x^{(i)}$$

The coefficient matrix **A** of each of these tri-diagonal linear system is defined with three vectors corresponding to its lower (**dl**), main (**d**), and upper (**du**) matrix diagonals; the right-hand sides are stored in the dense matrix **x**. Notice that solution **y** overwrites right-hand-side matrix **x** on exit. The different matrices are assumed to be of the same size and are stored with a fixed **batchStride** in memory.

The routine does not perform any pivoting and uses a combination of the Cyclic Reduction (CR) and the Parallel Cyclic Reduction (PCR) algorithms to find the solution. It achieves better performance when **m** is a power of 2.

This routine requires a significant amount of temporary extra storage  $((\text{batchCount} \times (4 \times m + 2048) \times \text{sizeof}(<\text{type}>)))$ . It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
---------------	---

<b>m</b>	the size of the linear system (must be $\geq 3$ ).
<b>dl</b>	<type> dense array containing the lower diagonal of the tri-diagonal linear system. The lower diagonal $dl^{(i)}$ that corresponds to the $i^{\text{th}}$ linear system starts at location $dl + \text{batchStride} \times i$ in memory. Also, the first element of each lower diagonal must be zero.
<b>d</b>	<type> dense array containing the main diagonal of the tri-diagonal linear system. The main diagonal $d^{(i)}$ that corresponds to the $i^{\text{th}}$ linear system starts at location $d + \text{batchStride} \times i$ in memory.
<b>du</b>	<type> dense array containing the upper diagonal of the tri-diagonal linear system. The upper diagonal $du^{(i)}$ that corresponds to the $i^{\text{th}}$ linear system starts at location $du + \text{batchStride} \times i$ in memory. Also, the last element of each upper diagonal must be zero.
<b>x</b>	<type> dense array that contains the right-hand-side of the tri-diagonal linear system. The right-hand-side $x^{(i)}$ that corresponds to the $i^{\text{th}}$ linear system starts at location $x + \text{batchStride} \times i$ in memory.
<b>batchCount</b>	number of systems to solve.
<b>batchStride</b>	stride (number of elements) that separates the vectors of every system (must be at least <b>m</b> ).

## Output

<b>x</b>	<type> dense array that contains the solution of the tri-diagonal linear system. The solution $x^{(i)}$ that corresponds to the $i^{\text{th}}$ linear system starts at location $x + \text{batchStride} \times i$ in memory.
----------	---

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( $m < 3$ , $\text{batchCount} \leq 0$ , $\text{batchStride} < m$ ).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

# Chapter 11.

## CUSPARSE FORMAT CONVERSION

### REFERENCE

This chapter describes the conversion routines between different sparse and dense storage formats.

## 11.1. `cusparse<t>bsr2csr()`

```

cusparseStatus_t
cusparseSbsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const float *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    float *csrValC,
    int *csrRowPtrC,
    int *csrColIndC)
cusparseStatus_t
cusparseDbbsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const double *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    double *csrValC,
    int *csrRowPtrC,
    int *csrColIndC)
cusparseStatus_t
cusparseCbsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const cuComplex *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    cuComplex *csrValC,
    int *csrRowPtrC,
    int *csrColIndC)
cusparseStatus_t
cusparseZbsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const cuDoubleComplex *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    cuDoubleComplex *csrValC,
    int *csrRowPtrC,
    int *csrColIndC)

```

This function converts a sparse matrix in BSR format that is defined by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA** into a sparse matrix in CSR format that is defined by arrays **csrValC**, **csrRowPtrC**, and **csrColIndC**.

Let  $m (=mb \cdot \text{blockDim})$  be the number of rows of **A** and  $n (=nb \cdot \text{blockDim})$  be number of columns of **A**, then **A** and **C** are  $m \times n$  sparse matrices. The BSR format of **A** contains  $\text{nnzb} (= \text{bsrRowPtrA}[mb] - \text{bsrRowPtrA}[0])$  nonzero blocks, whereas the sparse matrix **A** contains  $\text{nnz} (= \text{nnzb} \cdot \text{blockDim} \cdot \text{blockDim})$  elements. The user must allocate enough space for arrays **csrRowPtrC**, **csrColIndC**, and **csrValC**. The requirements are

**csrRowPtrC** of  $m+1$  elements,

**csrValC** of  $\text{nnz}$  elements, and

**csrColIndC** of  $\text{nnz}$  elements.

The general procedure is as follows:

```
// Given BSR format (bsrRowPtrA, bsrColIndA, bsrValA) and
// blocks of BSR format are stored in column-major order.
cusparsedirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int m = mb*blockDim;
int nnzb = bsrRowPtrA[mb] - bsrRowPtrA[0]; // number of blocks
int nnz = nnzb * blockDim * blockDim; // number of elements
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
cudaMalloc((void**)&csrColIndC, sizeof(int)*nnz);
cudaMalloc((void**)&csrValC, sizeof(float)*nnz);
cusparsesbsr2csr(handle, dir, mb, nb,
    descrA,
    bsrValA, bsrRowPtrA, bsrColIndA,
    blockDim,
    descrC,
    csrValC, csrRowPtrC, csrColIndC);
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>mb</b>	number of block rows of sparse matrix <b>A</b> .
<b>nb</b>	number of block columns of sparse matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> .
<b>bsrValA</b>	<type> array of $\text{nnzb} \cdot \text{blockDim} \cdot \text{blockDim}$ nonzero elements of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of $mb+1$ elements that contains the start of every block row and the end of the last block row plus one of matrix <b>A</b> .
<b>bsrColIndA</b>	integer array of $\text{nnzb}$ column indices of the nonzero blocks of matrix <b>A</b> .
<b>blockDim</b>	block dimension of sparse matrix <b>A</b> .
<b>descrC</b>	the descriptor of matrix <b>C</b> .

## Output

<code>csrValC</code>	<type> array of <code>nnz</code> ( <code>=csrRowPtrC[m] - csrRowPtrC[0]</code> ) nonzero elements of matrix <code>c</code> .
<code>csrRowPtrC</code>	integer array of <code>m+1</code> elements that contains the start of every row and the end of the last row plus one of matrix <code>c</code> .
<code>csrColIndC</code>	integer array of <code>nnz</code> column indices of the nonzero elements of matrix <code>c</code> .

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb, nb &lt; 0</code> , <code>IndexBase</code> of <code>descrA</code> , <code>descrC</code> is not base-0 or base-1, <code>dir</code> is not row-major or column-major, or <code>blockDim &lt; 1</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 11.2. `cusparse<T>gebsr2gebsc_bufferSize`

```
cusparseStatus_t
cusparseSgebsr2gebsc_bufferSize(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const float *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

```
cusparseStatus_t
cusparseDgebsr2gebsc_bufferSize(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const double *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

```
cusparseStatus_t
cusparseCgebsr2gebsc_bufferSize(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const cuComplex *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

```
cusparseStatus_t
cusparseZgebsr2gebsc_bufferSize(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const cuDoubleComplex *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

This function returns size of buffer used in computing **gebsr2gebsc**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>mb</b>	number of block rows of sparse matrix <b>A</b> .

<b>nb</b>	number of block columns of sparse matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>bsrVal</b>	<type> array of <b>nnzb*rowBlockDim*colBlockDim</b> non-zero elements of matrix <b>A</b> .
<b>bsrRowPtr</b>	integer array of <b>mb+1</b> elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColInd</b>	integer array of <b>nnzb</b> column indices of the non-zero blocks of matrix <b>A</b> .
<b>rowBlockDim</b>	number of rows within a block of <b>A</b> .
<b>colBlockDim</b>	number of columns within a block of <b>A</b> .

## Output

<b>pBufferSize</b>	host pointer containing number of bytes of the buffer used in the <b>gebsr2gebsc</b> .
--------------------	--

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>mb</b> , <b>nb</b> , <b>nnzb</b> <0, or <b>rowBlockDim</b> , <b>colBlockDim</b> <1).
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

## 11.3. `cusparse<t>gebsr2gebsc`

```
cusparseStatus_t
cusparseSgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const float *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    float *bscVal,
    int *bscRowInd,
    int *bscColPtr,
    cusparseAction_t copyValues,
    cusparseIndexBase_t baseIdx,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseDgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const double *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    double *bscVal,
    int *bscRowInd,
    int *bscColPtr,
    cusparseAction_t copyValues,
    cusparseIndexBase_t baseIdx,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseCgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const cuComplex *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    cuComplex *bscVal,
    int *bscRowInd,
    int *bscColPtr,
    cusparseAction_t copyValues,
    cusparseIndexBase_t baseIdx,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseZgebsr2gebsc(cusparseHandle_t handle,
    int mb,
    int nb,
    int nnzb,
    const cuDoubleComplex *bsrVal,
    const int *bsrRowPtr,
    const int *bsrColInd,
    int rowBlockDim,
    int colBlockDim,
    cuDoubleComplex *bscVal,
    int *bscRowInd,
```

This function can be seen as the same as **csr2csc** when regarding each block of size **rowBlockDim\*colBlockDim** as a scalar.

This sparsity pattern of result matrix can also be seen as the transpose of the original sparse matrix but memory layout of a block does not change.

The user must know the size of buffer required by **gebsr2gebsc** by calling **gebsr2gebsc\_bufferSize**, allocate the buffer and pass the buffer pointer to **gebsr2gebsc**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>mb</b>	number of block rows of sparse matrix <b>A</b> .
<b>nb</b>	number of block columns of sparse matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>bsrVal</b>	<type> array of <b>nnzb*rowBlockDim*colBlockDim</b> non-zero elements of matrix <b>A</b> .
<b>bsrRowPtr</b>	integer array of <b>mb+1</b> elements that contains the start of every block row and the end of the last block row plus one.
<b>bsrColInd</b>	integer array of <b>nnzb</b> column indices of the non-zero blocks of matrix <b>A</b> .
<b>rowBlockDim</b>	number of rows within a block of <b>A</b> .
<b>colBlockDim</b>	number of columns within a block of <b>A</b> .
<b>copyValues</b>	CUSPARSE_ACTION_SYMBOLIC or CUSPARSE_ACTION_NUMERIC.
<b>baseIdx</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.
<b>pBuffer</b>	buffer allocated by the user, the size is return by <b>gebsr2gebsc_bufferSize</b> .

### Output

<b>bscVal</b>	<type> array of <b>nnzb*rowBlockDim*colBlockDim</b> non-zero elements of matrix <b>A</b> . It is only filled-in if <b>copyValues</b> is set to CUSPARSE_ACTION_NUMERIC.
<b>bscRowInd</b>	integer array of <b>nnzb</b> row indices of the non-zero blocks of matrix <b>A</b> .
<b>bscColPtr</b>	integer array of <b>nb+1</b> elements that contains the start of every block column and the end of the last block column plus one.

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.

CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( <i>mb</i> , <i>nb</i> , <i>nnzb</i> <0, <i>baseIdx</i> is not base-0 or base-1, or <i>rowBlockDim</i> , <i>colBlockDim</i> <1).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.

## 11.4. `cusparse<t>gebsr2gebsr_bufferSize`

```
cusparseStatus_t
cusparseSgebsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const float *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    int rowBlockDimC,
    int colBlockDimC,
    int *pBufferSize )
```

```
cusparseStatus_t
cusparseDgebsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const double *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    int rowBlockDimC,
    int colBlockDimC,
    int *pBufferSize )
```

```
cusparseStatus_t
cusparseCgebsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const cuComplex *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    int rowBlockDimC,
    int colBlockDimC,
    int *pBufferSize )
```

```
cusparseStatus_t
cusparseZgebsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const cuDoubleComplex *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    int rowBlockDimC,
    int colBlockDimC,
    int *pBufferSize )
```

This function returns size of buffer used in computing **gebsr2gebsrNnz** and **gebsr2gebsr**.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>mb</b>	number of block rows of sparse matrix <b>A</b> .
<b>nb</b>	number of block columns of sparse matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>bsrValA</b>	<type> array of <code>nnzb*rowBlockDimA*colBlockDimA</code> non-zero elements of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <code>mb+1</code> elements that contains the start of every block row and the end of the last block row plus one of matrix <b>A</b> .
<b>bsrColIndA</b>	integer array of <code>nnzb</code> column indices of the non-zero blocks of matrix <b>A</b> .
<b>rowBlockDimA</b>	number of rows within a block of <b>A</b> .
<b>colBlockDimA</b>	number of columns within a block of <b>A</b> .
<b>rowBlockDimC</b>	number of rows within a block of <b>c</b> .
<b>colBlockDimC</b>	number of columns within a block of <b>c</b> .

### Output

<b>pBufferSize</b>	host pointer containing number of bytes of the buffer used in the <b>gebsr2gebsr</b> .
--------------------	--

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>mb</code> , <code>nb</code> , <code>nnzb</code> < 0, or <code>rowBlockDimA</code> , <code>colBlockDimA</code> , <code>rowBlockDimC</code> , <code>colBlockDimC</code> < 1).
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 11.5. `cusparse<t>gebsr2gebsr`

```
cusparseStatus_t
cusparseXgebsr2gebsrNnz(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    const cusparseMatDescr_t descrC,
    int *bsrRowPtrC,
    int rowBlockDimC,
    int colBlockDimC,
    int *nnzTotalDevHostPtr,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseSgebsr2gebsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const float *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    const cusparseMatDescr_t descrC,
    float *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC,
    int rowBlockDimC,
    int colBlockDimC,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseDgebsr2gebsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
    const cusparseMatDescr_t descrA,
    const double *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDimA,
    int colBlockDimA,
    const cusparseMatDescr_t descrC,
    double *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC,
    int rowBlockDimC,
    int colBlockDimC,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseCgebsr2gebsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    int nnzb,
```

This function converts a sparse matrix in general BSR format (that is defined by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**) into a sparse matrix in another general BSR format (that is defined by arrays **bsrValC**, **bsrRowPtrC**, and **bsrColIndC**).

If **rowBlockDimA=1** and **colBlockDimA=1**, **cusparse[S|D|C|Z]gebsr2gebsr** is the same as **cusparse[S|D|C|Z]csr2gebsr**.

If **rowBlockDimC=1** and **colBlockDimC=1**, **cusparse[S|D|C|Z]gebsr2gebsr** is the same as **cusparse[S|D|C|Z]gebsr2csr**.

**A** is a  $m \times n$  sparse matrix where  $m (=mb \times \text{rowBlockDim})$  is number of rows of **A** and  $n (=nb \times \text{colBlockDim})$  is number of columns of **A**. General BSR format of **A** contains  $\text{nnzb} (= \text{bsrRowPtrA}[mb] - \text{bsrRowPtrA}[0])$  non-zero blocks. The matrix **C** is also a general BSR format with different block size,  $\text{rowBlockDimC} \times \text{colBlockDimC}$ . If  $m$  is not multiple of **rowBlockDimC** or  $n$  is not multiple of **colBlockDimC**, zeros are filled in. The number of block rows of **C** is  $mc = (m + \text{rowBlockDimC} - 1) / \text{rowBlockDimC}$ . The number of block rows of **C** is  $nc = (n + \text{colBlockDimC} - 1) / \text{colBlockDimC}$ . The number of nonzero blocks of **C** is **nnzc**.

The implementation adopts a two-step approach to do the conversion. First, the user allocates **bsrRowPtrC** of  $mc+1$  elements and uses function **cusparseXgebsr2gebsrNnz** to determine number of non-zero block columns per block row of matrix **C**. Second, the user gathers **nnzc** (number of non-zero block columns of matrix **C**) from either ( $\text{nnzc} = * \text{nnzTotalDevHostPtr}$ ) or ( $\text{nnzc} = \text{bsrRowPtrC}[mc] - \text{bsrRowPtrC}[0]$ ) and allocates **bsrValC** of  $\text{nnzc} \times \text{rowBlockDimC} \times \text{colBlockDimC}$  elements and **bsrColIndC** of **nnzc** integers. Finally the function **cusparse[S|D|C|Z]gebsr2gebsr** is called to complete the conversion.

The user must know the size of buffer required by **gebsr2gebsr** by calling **gebsr2gebsr\_bufferSize**, allocate the buffer and pass the buffer pointer to **gebsr2gebsr**.

The general procedure is as follows:

```
// Given general BSR format (bsrRowPtrA, bsrColIndA, bsrValA) and
// blocks of BSR format are stored in column-major order.
cusparsedirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int base, nnzc;
int m = mb*rowBlockDimA;
int n = nb*colBlockDimA;
int mc = (m+rowBlockDimC-1)/rowBlockDimC;
int nc = (n+colBlockDimC-1)/colBlockDimC;
int bufferSize;
char *pBuffer;
cusparsesgebsr2gebsr_bufferSize(handle, dir, mb, nb, nnzb,
    descrA, bsrValA, bsrRowPtrA, bsrColIndA,
    rowBlockDimA, colBlockDimA,
    rowBlockDimC, colBlockDimC,
    &bufferSize);
cudaMalloc((void**)&pBuffer, bufferSize);
cudaMalloc((void**)&bsrRowPtrC, sizeof(int)*(mc+1));
// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzc;
cusparsesgebsr2gebsrNnz(handle, dir, mb, nb, nnzb,
    descrA, bsrRowPtrA, bsrColIndA,
    rowBlockDimA, colBlockDimA,
    descrC, bsrRowPtrC,
    rowBlockDimC, colBlockDimC,
    nnzTotalDevHostPtr,
    pBuffer);
if (NULL != nnzTotalDevHostPtr){
    nnzc = *nnzTotalDevHostPtr;
}else{
    cudaMemcpy(&nnzc, bsrRowPtrC+mc, sizeof(int), cudaMemcpyDeviceToHost);
    cudaMemcpy(&base, bsrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
    nnzc -= base;
}
cudaMalloc((void**)&bsrColIndC, sizeof(int)*nnzc);
cudaMalloc((void**)&bsrValC, sizeof(float)*(rowBlockDimC*colBlockDimC)*nnzc);
cusparsesgebsr2gebsr(handle, dir, mb, nb, nnzb,
    descrA, bsrValA, bsrRowPtrA, bsrColIndA,
    rowBlockDimA, colBlockDimA,
    descrC, bsrValC, bsrRowPtrC, bsrColIndC,
    rowBlockDimC, colBlockDimC,
    pBuffer);
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>mb</b>	number of block rows of sparse matrix <b>A</b> .
<b>nb</b>	number of block columns of sparse matrix <b>A</b> .
<b>nnzb</b>	number of nonzero blocks of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>bsrValA</b>	<type> array of <code>nnzb*rowBlockDimA*colBlockDimA</code> non-zero elements of matrix <b>A</b> .

<b>bsrRowPtrA</b>	integer array of <b>mb+1</b> elements that contains the start of every block row and the end of the last block row plus one of matrix <b>A</b> .
<b>bsrColIndA</b>	integer array of <b>nnzb</b> column indices of the non-zero blocks of matrix <b>A</b> .
<b>rowBlockDimA</b>	number of rows within a block of <b>A</b> .
<b>colBlockDimA</b>	number of columns within a block of <b>A</b> .
<b>descrC</b>	the descriptor of matrix <b>C</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>rowBlockDimC</b>	number of rows within a block of <b>c</b>
<b>colBlockDimC</b>	number of columns within a block of <b>c</b>
<b>pBuffer</b>	buffer allocated by the user, the size is return by <b>gebsr2gebsr_bufferSize</b> .

## Output

<b>bsrValC</b>	<type> array of <b>nnzc*rowBlockDimC*colBlockDimC</b> non-zero elements of matrix <b>C</b> .
<b>bsrRowPtrC</b>	integer array of <b>mc+1</b> elements that contains the start of every block row and the end of the last block row plus one of matrix <b>C</b> .
<b>bsrColIndC</b>	integer array of <b>nnzc</b> block column indices of the non-zero blocks of matrix <b>C</b> .
<b>nnzTotalDevHostPtr</b>	total number of nonzero blocks of <b>C</b> . * <b>nnzTotalDevHostPtr</b> is the same as <b>bsrRowPtrC[mc]-bsrRowPtrC[0]</b>

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>mb</b> , <b>nb</b> , <b>nnzb</b> <0, <b>baseIdx</b> is not base-0 or base-1, or <b>rowBlockDimA</b> , <b>colBlockDimA</b> , <b>rowBlockDimC</b> , <b>colBlockDimC</b> <1).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

## 11.6. `cusparse<t>gebsr2csr`

```

cusparseStatus_t
cusparseSgebsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const float *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDim,
    int colBlockDim,
    const cusparseMatDescr_t descrC,
    float *csrValC,
    int *csrRowPtrC,
    int *csrColIndC )
cusparseStatus_t
cusparseDgebsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const double *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDim,
    int colBlockDim,
    const cusparseMatDescr_t descrC,
    double *csrValC,
    int *csrRowPtrC,
    int *csrColIndC )
cusparseStatus_t
cusparseCgebsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const cuComplex *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDim,
    int colBlockDim,
    const cusparseMatDescr_t descrC,
    cuComplex *csrValC,
    int *csrRowPtrC,
    int *csrColIndC )
cusparseStatus_t
cusparseZgebsr2csr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int mb,
    int nb,
    const cusparseMatDescr_t descrA,
    const cuDoubleComplex *bsrValA,
    const int *bsrRowPtrA,
    const int *bsrColIndA,
    int rowBlockDim,
    int colBlockDim,
    const cusparseMatDescr_t descrC,
    cuDoubleComplex *csrValC,
    int *csrRowPtrC,
    int *csrColIndC )

```

This function converts a sparse matrix in general BSR format (that is defined by the three arrays **bsrValA**, **bsrRowPtrA**, and **bsrColIndA**) into a sparse matrix in CSR format (that is defined by arrays **csrValC**, **csrRowPtrC**, and **csrColIndC**).

Let  $m(=mb \cdot \text{rowBlockDim})$  be number of rows of **A** and  $n(=nb \cdot \text{colBlockDim})$  be number of columns of **A**, then **A** and **C** are  $m \times n$  sparse matrices. General BSR format of **A** contains **nnzb** ( $=\text{bsrRowPtrA}[mb] - \text{bsrRowPtrA}[0]$ ) non-zero blocks whereas sparse matrix **A** contains **nnz** ( $=\text{nnzb} \cdot \text{rowBlockDim} \cdot \text{colBlockDim}$ ) elements. The user must allocate enough space for arrays **csrRowPtrC**, **csrColIndC** and **csrValC**. The requirements are

**csrRowPtrC** of  $m+1$  elements,

**csrValC** of **nnz** elements, and

**csrColIndC** of **nnz** elements.

The general procedure is as follows:

```
// Given general BSR format (bsrRowPtrA, bsrColIndA, bsrValA) and
// blocks of BSR format are stored in column-major order.
cusparsedirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int m = mb*rowBlockDim;
int n = nb*colBlockDim;
int nnzb = bsrRowPtrA[mb] - bsrRowPtrA[0]; // number of blocks
int nnz = nnzb * rowBlockDim * colBlockDim; // number of elements
cudaMalloc((void**)&csrRowPtrC, sizeof(int)*(m+1));
cudaMalloc((void**)&csrColIndC, sizeof(int)*nnz);
cudaMalloc((void**)&csrValC, sizeof(float)*nnz);
cusparsesgebsr2csr(handle, dir, mb, nb,
    descrA,
    bsrValA, bsrRowPtrA, bsrColIndA,
    rowBlockDim, colBlockDim,
    descrC,
    csrValC, csrRowPtrC, csrColIndC);
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>mb</b>	number of block rows of sparse matrix <b>A</b> .
<b>nb</b>	number of block columns of sparse matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>bsrValA</b>	<type> array of <b>nnzb*rowBlockDim*colBlockDim</b> non-zero elements of matrix <b>A</b> .
<b>bsrRowPtrA</b>	integer array of <b>mb+1</b> elements that contains the start of every block row and the end of the last block row plus one of matrix <b>A</b> .
<b>bsrColIndA</b>	integer array of <b>nnzb</b> column indices of the non-zero blocks of matrix <b>A</b> .

<code>rowBlockDim</code>	number of rows within a block of <b>A</b> .
<code>colBlockDim</code>	number of columns within a block of <b>A</b> .
<code>descrC</code>	the descriptor of matrix <b>C</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .

## Output

<code>csrValC</code>	<type> array of <b>nnz</b> non-zero elements of matrix <b>C</b> .
<code>csrRowPtrC</code>	integer array of <b>m+1</b> elements that contains the start of every row and the end of the last row plus one of matrix <b>C</b> .
<code>csrColIndC</code>	integer array of <b>nnz</b> column indices of the non-zero elements of matrix <b>c</b> .

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <b>mb</b> , <b>nb</b> <0, <b>baseIdx</b> is not base-0 or base-1, or <b>rowBlockDim</b> , <b>colBlockDim</b> <1).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 11.7. `cusparse<t>csr2gebsr_bufferSize()`

```
cusparseStatus_t
cusparseScsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const float *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

```
cusparseStatus_t
cusparseDcsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const double *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

```
cusparseStatus_t
cusparseCcsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const cuComplex *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

```
cusparseStatus_t
cusparseZcsr2gebsr_bufferSize(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const cuDoubleComplex *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int rowBlockDim,
    int colBlockDim,
    int *pBufferSize)
```

This function returns the size of the buffer used in computing **csr2gebsrNnz** and **csr2gebsr**.

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>m</b>	number of rows of sparse matrix <b>A</b> .
<b>n</b>	number of columns of sparse matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>csrValA</b>	<type> array of <b>nnz</b> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m</b> +1 elements that contains the start of every row and the end of the last row plus one of matrix <b>A</b> .
<b>csrColIndA</b>	integer array of <b>nnz</b> column indices of the nonzero elements of matrix <b>A</b> .
<b>descrC</b>	the descriptor of matrix <b>C</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>rowBlockDim</b>	number of rows within a block of <b>C</b> .
<b>colBlockDim</b>	number of columns within a block of <b>C</b> .

## Output

<b>pBufferSize</b>	host pointer containing number of bytes of the buffer used in <code>csr2gebsrNnz()</code> and <code>csr2gebsr()</code> .
--------------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <b>m</b> , <b>n</b> <0, or <b>rowBlockDim</b> , <b>colBlockDim</b> <1).
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 11.8. `cusparse<t>csr2gebsr()`

```
cusparseStatus_t
cusparseXcsr2gebsrNnz(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    const cusparseMatDescr_t descrC,
    int *bsrRowPtrC,
    int rowBlockDim,
    int colBlockDim,
    int *nnzTotalDevHostPtr,
    char *pBuffer )
```

```
cusparseStatus_t
cusparseScsr2gebsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const float *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    const cusparseMatDescr_t descrC,
    float *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC,
    int rowBlockDim,
    int colBlockDim,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseDcsr2gebsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const double *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    const cusparseMatDescr_t descrC,
    double *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC,
    int rowBlockDim,
    int colBlockDim,
    char *pBuffer)
```

```
cusparseStatus_t
cusparseCcsr2gebsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const cuComplex *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    const cusparseMatDescr_t descrC,
    cuComplex *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC,
    int rowBlockDim,
```

This function converts a sparse matrix **A** in CSR format (that is defined by arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**) into a sparse matrix **C** in general BSR format (that is defined by the three arrays **bsrValC**, **bsrRowPtrC**, and **bsrColIndC**).

The matrix **A** is a **m\*n** sparse matrix and matrix **C** is a **(mb\*rowBlockDim) \* (nb\*colBlockDim)** sparse matrix, where **mb** **(= (m + rowBlockDim - 1) / rowBlockDim)** is the number of block rows of **C**, and **nb** **(= (n + colBlockDim - 1) / colBlockDim)** is the number of block columns of **C**.

The block of **C** is of size **rowBlockDim\*colBlockDim**. If **m** is not multiple of **rowBlockDim** or **n** is not multiple of **colBlockDim**, zeros are filled in.

The implementation adopts a two-step approach to do the conversion. First, the user allocates **bsrRowPtrC** of **mb+1** elements and uses function **cusparseXcsr2gebsrNnz()** to determine the number of nonzero block columns per block row. Second, the user gathers **nnzb** (number of nonzero block columns of matrix **C**) from either **(nnzb=\*nnzTotalDevHostPtr)** or **(nnzb=bsrRowPtrC[mb]-bsrRowPtrC[0])** and allocates **bsrValC** of **nnzb\*rowBlockDim\*colBlockDim** elements and **bsrColIndC** of **nnzb** integers. Finally function **cusparse[S|D|C|Z]csr2gebsr()** is called to complete the conversion.

The user must obtain the size of the buffer required by **csr2gebsr()** by calling **csr2gebsr\_bufferSize()**, allocate the buffer, and pass the buffer pointer to **csr2gebsr()**.

The general procedure is as follows:

```
// Given CSR format (csrRowPtrA, csrColIndA, csrValA) and
// blocks of BSR format are stored in column-major order.
cusparsedirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int base, nnzb;
int mb = (m + rowBlockDim-1)/rowBlockDim;
int nb = (n + colBlockDim-1)/colBlockDim;
int bufferSize;
char *pBuffer;
cusparsescsr2gebsr_bufferSize(handle, dir, m, n,
    descrA, csrValA, csrRowPtrA, csrColIndA,
    rowBlockDim, colBlockDim,
    &bufferSize);
cudaMalloc((void**)&pBuffer, bufferSize);
cudaMalloc((void**)&bsrRowPtrC, sizeof(int) * (mb+1));
// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzb;
cusparsexcscr2gebsrNnz(handle, dir, m, n,
    descrA, csrRowPtrA, csrColIndA,
    descrC, bsrRowPtrC, rowBlockDim, colBlockDim,
    nnzTotalDevHostPtr,
    pBuffer);
if (NULL != nnzTotalDevHostPtr){
    nnzb = *nnzTotalDevHostPtr;
}else{
    cudaMemcpy(&nnzb, bsrRowPtrC+mb, sizeof(int), cudaMemcpyDeviceToHost);
    cudaMemcpy(&base, bsrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
    nnzb -= base;
}
cudaMalloc((void**)&bsrColIndC, sizeof(int) * nnzb);
cudaMalloc((void**)&bsrValC, sizeof(float) * (rowBlockDim * colBlockDim) * nnzb);
cusparsescsr2gebsr(handle, dir, m, n,
    descrA,
    csrValA, csrRowPtrA, csrColIndA,
    descrC,
    bsrValC, bsrRowPtrC, bsrColIndC,
    rowBlockDim, colBlockDim,
    pBuffer);
```

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <code>CUSPARSE_DIRECTION_ROW</code> or <code>CUSPARSE_DIRECTION_COLUMN</code> .
<b>m</b>	number of rows of sparse matrix <b>A</b> .
<b>n</b>	number of columns of sparse matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>csrValA</b>	<type> array of <b>nnz</b> nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m</b> +1 elements that contains the start of every row and the end of the last row plus one of matrix <b>A</b> .
<b>csrColIndA</b>	integer array of <b>nnz</b> column indices of the nonzero elements of matrix <b>A</b> .

<b>descrC</b>	the descriptor of matrix c. The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>rowBlockDim</b>	number of rows within a block of c.
<b>colBlockDim</b>	number of columns within a block of c.
<b>pBuffer</b>	buffer allocated by the user, the size is return by <code>csr2gebsr_bufferSize()</code> .

## Output

<b>bsrValC</b>	<type> array of <code>nnzb*rowBlockDim*colBlockDim</code> nonzero elements of matrix c.
<b>bsrRowPtrC</b>	integer array of <code>mb+1</code> elements that contains the start of every block row and the end of the last block row plus one of matrix c.
<b>bsrColIndC</b>	integer array of <code>nnzb</code> column indices of the nonzero blocks of matrix c.
<b>nnzTotalDevHostPtr</b>	total number of nonzero blocks of matrix c. Pointer <code>nnzTotalDevHostPtr</code> can point to a device memory or host memory.

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m,n&lt;0</code> , <code>baseIdx</code> is not base-0 or base-1, or <code>rowBlockDim</code> , <code>colBlockDim&lt;1</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.

## 11.9. `cusparse<t>coo2csr`

```
cusparseStatus_t
cusparseXcoo2csr(cusparseHandle_t handle, const int *cooRowInd,
                 int nnz, int m, int *csrRowPtr, cusparseIndexBase_t
                 idxBase)
```

This function converts the array containing the uncompressed row indices (corresponding to COO format) into an array of compressed row pointers (corresponding to CSR format).

It can also be used to convert the array containing the uncompressed column indices (corresponding to COO format) into an array of column pointers (corresponding to CSC format).

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>cooRowInd</b>	integer array of <b>nnz</b> uncompressed row indices.
<b>nnz</b>	number of non-zeros of the sparse matrix (that is also the length of array <b>cooRowInd</b> ).
<b>m</b>	number of rows of matrix <i>A</i> .
<b>idxBase</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.

### Output

<b>csrRowPtr</b>	integer array of <b>m</b> +1 elements that contains the start of every row and the end of the last row plus one.
------------------	--

### Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_INVALID_VALUE	<b>IdxBase</b> is neither CUSPARSE_INDEX_BASE_ZERO nor CUSPARSE_INDEX_BASE_ONE.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU

## 11.10. `cusparse<t>csc2dense()`

```

cusparseStatus_t
cusparseScsc2dense(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const float *cscValA,
                  const int *cscRowIndA, const int *cscColPtrA,
                  float *A, int lda)

cusparseStatus_t
cusparseDcsc2dense(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const double *cscValA,
                  const int *cscRowIndA, const int *cscColPtrA,
                  double *A, int lda)

cusparseStatus_t
cusparseCcsc2dense(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const cuComplex *cscValA,
                  const int *cscRowIndA, const int *cscColPtrA,
                  cuComplex *A, int lda)

cusparseStatus_t
cusparseZcsc2dense(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const cuDoubleComplex *cscValA,
                  const int *cscRowIndA, const int *cscColPtrA,
                  cuDoubleComplex *A, int lda)

```

This function converts the sparse matrix in CSC format (that is defined by the three arrays **cscValA**, **cscColPtrA**, and **cscRowIndA**) into the matrix **A** in dense format. The dense matrix **A** is filled in with the values of the sparse matrix and with zeros elsewhere.

This function requires no extra storage. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>cscValA</b>	<type> array of <code>nnz (= cscColPtrA(m) - cscColPtrA(0) )</code> nonzero elements of matrix <b>A</b> .
<b>cscRowIndA</b>	integer array of <code>nnz (= cscColPtrA(m) - cscColPtrA(0) )</code> row indices of the nonzero elements of matrix <b>A</b> .
<b>cscColPtrA</b>	integer array of <code>n+1</code> elements that contains the start of every row and the end of the last column plus one.
<b>lda</b>	leading dimension of dense array <b>A</b> .

## Output

<b>A</b>	array of dimensions (1d <b>a</b> , <b>n</b> ) that is filled in with the values of the sparse matrix.
----------	---

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>n</b> <0).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 11.11. `cusparse<t>csc2hyb`

```

cusparseStatus_t
cusparseScsc2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const float *cscValA,
                 const int *cscRowIndA, const int *cscColPtrA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)
cusparseStatus_t
cusparseDcsc2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const double *cscValA,
                 const int *cscRowIndA, const int *cscColPtrA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)
cusparseStatus_t
cusparseCcsc2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const cuComplex *cscValA,
                 const int *cscRowIndA, const int *cscColPtrA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)
cusparseStatus_t
cusparseZcsc2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const cuDoubleComplex *cscValA,
                 const int *cscRowIndA, const int *cscColPtrA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)

```

This function converts a sparse matrix in CSC format into a sparse matrix in HYB format. It assumes that the **hybA** parameter has been initialized with **cusparseCreateHybMat** routine before calling this function.

This function requires some amount of temporary storage and a significant amount of storage for the matrix in HYB format. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

## Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <i>A</i> .
<b>n</b>	number of columns of matrix <i>A</i> .
<b>descrA</b>	the descriptor of matrix <i>A</i> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>cscValA</b>	<type> array of <code>nnz (= cscColPtrA(m) - cscColPtrA(0) )</code> non-zero elements of matrix <i>A</i> .
<b>cscRowIndA</b>	integer array of <code>nnz (= cscColPtrA(m) - cscColPtrA(0) )</code> column indices of the non-zero elements of matrix <i>A</i> .
<b>cscColPtrA</b>	integer array of <code>m+1</code> elements that contains the start of every row and the end of the last row plus one.
<b>userEllWidth</b>	width of the regular (ELL) part of the matrix in HYB format, which should be less than maximum number of non-zeros per row and is only required if <code>partitionType == CUSPARSE_HYB_PARTITION_USER</code> .
<b>partitionType</b>	partitioning method to be used in the conversion (please refer to <code>cusparsHybPartition_t</code> on page ?? for details).

## Output

<b>hybA</b>	the matrix <i>A</i> in HYB storage format.
-------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, n &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 11.12. cusparse<t>csr2bsr

```

cusparseStatus_t
cusparseXcsr2bsrNnz(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    int *bsrRowPtrC,
    int *nnzTotalDevHostPtr)
cusparseStatus_t
cusparseScsr2bsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const float *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    float *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC)
cusparseStatus_t
cusparseDcsr2bsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const double *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    double *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC)
cusparseStatus_t
cusparseCcsr2bsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const cuComplex *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int blockDim,
    const cusparseMatDescr_t descrC,
    cuComplex *bsrValC,
    int *bsrRowPtrC,
    int *bsrColIndC)
cusparseStatus_t
cusparseZcsr2bsr(cusparseHandle_t handle,
    cusparseDirection_t dir,
    int m,
    int n,
    const cusparseMatDescr_t descrA,
    const cuDoubleComplex *csrValA,
    const int *csrRowPtrA,
    const int *csrColIndA,
    int blockDim,

```

This function converts a sparse matrix in CSR format (that is defined by the three arrays **csrValA**, **csrRowPtrA** and **csrColIndA**) into a sparse matrix in BSR format (that is defined by arrays **bsrValC**, **bsrRowPtrC** and **bsrColIndC**).

**A** is a **m\*n** sparse matrix. The BSR format of **A** has **mb** block rows, **nb** block columns and **nnzb** nonzero blocks where **mb**= **(m+blockDim-1)/blockDim** and **nb**= **(n+blockDim-1)/blockDim**.

If **m** or **n** is not multiple of **blockDim**, zeros are filled in.

cuSPARSE adopts two-step approach to do the conversion. First, the user allocates **bsrRowPtrC** of **mb+1** elements and uses function **cusparseXcsr2bsrNnz** to determine number of non-zero block columns per block row. Second, the user gathers **nnzb** (number of non-zero block columns of matrix C) from either (**nnzb=\*nnzTotalDevHostPtr**) or (**nnzb=bsrRowPtrC[mb]-bsrRowPtrC[0]**) and allocates **bsrValC** of **nnzb\*blockDim\*blockDim** elements and **bsrColIndC** of **nnzb** elements. Finally function **cusparse[S|D|C|Z]csr2bsr** is called to complete the conversion.

The general procedure is as follows:

```
// Given CSR format (csrRowPtrA, csrColIndA, csrValA) and
// blocks of BSR format are stored in column-major order.
cusparseDirection_t dir = CUSPARSE_DIRECTION_COLUMN;
int base, nnzb;
int mb = (m + blockDim-1)/blockDim;
cudaMalloc((void**)&bsrRowPtrC, sizeof(int) * (mb+1));
// nnzTotalDevHostPtr points to host memory
int *nnzTotalDevHostPtr = &nnzb;
cusparseXcsr2bsrNnz(handle, dir, m, n,
    descrA, csrRowPtrA, csrColIndA,
    blockDim,
    descrC, bsrRowPtrC,
    nnzTotalDevHostPtr);
if (NULL != nnzTotalDevHostPtr){
    nnzb = *nnzTotalDevHostPtr;
}else{
    cudaMemcpy(&nnzb, bsrRowPtrC+mb, sizeof(int), cudaMemcpyDeviceToHost);
    cudaMemcpy(&base, bsrRowPtrC, sizeof(int), cudaMemcpyDeviceToHost);
    nnzb -= base;
}
cudaMalloc((void**)&bsrColIndC, sizeof(int)*nnzb);
cudaMalloc((void**)&bsrValC, sizeof(float)*(blockDim*blockDim)*nnzb);
cusparseScsr2bsr(handle, dir, m, n,
    descrA,
    csrValA, csrRowPtrA, csrColIndA,
    blockDim,
    descrC,
    bsrValC, bsrRowPtrC, bsrColIndC);
```

If **blockDim** is large (typically a block cannot fit into shared memory), **cusparse[S|D|C|Z]csr2bsr** will allocate temporary integer array of size **mb\*blockDim** integers. If device memory is not available, **CUSPARSE\_STATUS\_ALLOC\_FAILED** is returned.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dir</b>	storage format of blocks, either <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .

<b>m</b>	number of rows of sparse matrix <i>A</i> .
<b>n</b>	number of columns of sparse matrix <i>A</i> .
<b>descrA</b>	the descriptor of matrix <i>A</i> .
<b>csrValA</b>	<type> array of <b>nnz</b> ( $=\text{csrRowPtrA}[\text{m}] - \text{csrRowPtrA}[0]$ ) non-zero elements of matrix <i>A</i> .
<b>csrRowPtrA</b>	integer array of <b>m+1</b> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> column indices of the non-zero elements of matrix <i>A</i> .
<b>blockDim</b>	block dimension of sparse matrix <i>A</i> . The range of <b>blockDim</b> is between 1 and $\min(\text{m}, \text{n})$ .
<b>descrC</b>	the descriptor of matrix <i>C</i> .

## Output

<b>bsrValC</b>	<type> array of <b>nnzb*blockDim*blockDim</b> non-zero elements of matrix <i>C</i> .
<b>bsrRowPtrC</b>	integer array of <b>mb+1</b> elements that contains the start of every block row and the end of the last block row plus one of matrix <i>C</i> .
<b>bsrColIndC</b>	integer array of <b>nnzb</b> column indices of the non-zero blocks of matrix <i>C</i> .
<b>nnzTotalDevHostPtr</b>	total number of nonzero elements in device or host memory. It is equal to $(\text{bsrRowPtrC}[\text{mb}] - \text{bsrRowPtrC}[0])$ .

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>n</b> < 0). IndexBase field of <b>descrA</b> , <b>descrC</b> is not base-0 or base-1, <b>dir</b> is not row-major or column-major, or <b>blockDim</b> is not between 1 and $\min(\text{m}, \text{n})$ .
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.

## 11.13. `cusparse<t>csr2coo`

```
cusparseStatus_t
cusparseXcsr2coo(cusparseHandle_t handle, const int *csrRowPtr,
                 int nnz, int m, int *cooRowInd,
                 cusparseIndexBase_t idxBase)
```

This function converts the array containing the compressed row pointers (corresponding to CSR format) into an array of uncompressed row indices (corresponding to COO format).

It can also be used to convert the array containing the compressed column indices (corresponding to CSC format) into an array of uncompressed column indices (corresponding to COO format).

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>csrRowPtr</b>	integer array of <b>m</b> +1 elements that contains the start of every row and the end of the last row plus one.
<b>nnz</b>	number of nonzeros of the sparse matrix (that is also the length of array <b>cooRowInd</b> ).
<b>m</b>	number of rows of matrix <i>A</i> .
<b>idxBase</b>	<code>CUSPARSE_INDEX_BASE_ZERO</code> or <code>CUSPARSE_INDEX_BASE_ONE</code> .

### Output

<b>cooRowInd</b>	integer array of <b>nnz</b> uncompressed row indices.
------------------	---

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	<b>IndexBase</b> is neither <code>CUSPARSE_INDEX_BASE_ZERO</code> nor <code>CUSPARSE_INDEX_BASE_ONE</code> .
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU

## 11.14. `cusparse<t>csr2csc()`

```

cusparseStatus_t
cusparseScsr2csc(cusparseHandle_t handle, int m, int n, int nnz,
                 const float *csrVal, const int *csrRowPtr,
                 const int *csrColInd, float *cscVal,
                 int *cscRowInd, int *cscColPtr,
                 cusparseAction_t copyValues,
                 cusparseIndexBase_t idxBase)

cusparseStatus_t
cusparseDcsr2csc(cusparseHandle_t handle, int m, int n, int nnz,
                 const double *csrVal, const int *csrRowPtr,
                 const int *csrColInd, double *cscVal,
                 int *cscRowInd, int *cscColPtr,
                 cusparseAction_t copyValues,
                 cusparseIndexBase_t idxBase)

cusparseStatus_t
cusparseCcsr2csc(cusparseHandle_t handle, int m, int n, int nnz,
                 const cuComplex *csrVal, const int *csrRowPtr,
                 const int *csrColInd, cuComplex *cscVal,
                 int *cscRowInd, int *cscColPtr,
                 cusparseAction_t copyValues,
                 cusparseIndexBase_t idxBase)

cusparseStatus_t
cusparseZcsr2csc(cusparseHandle_t handle, int m, int n, int nnz,
                 const cuDoubleComplex *csrVal, const int *csrRowPtr,
                 const int *csrColInd, cuDoubleComplex *cscVal,
                 int *cscRowInd, int *cscColPtr,
                 cusparseAction_t copyValues,
                 cusparseIndexBase_t idxBase)

```

This function converts a sparse matrix in CSR format (that is defined by the three arrays **csrVal**, **csrRowPtr**, and **csrColInd**) into a sparse matrix in CSC format (that is defined by arrays **cscVal**, **cscRowInd**, and **cscColPtr**). The resulting matrix can also be seen as the transpose of the original sparse matrix. Notice that this routine can also be used to convert a matrix in CSC format into a matrix in CSR format.

This function requires a significant amount of extra storage that is proportional to the matrix size. It is executed asynchronously with respect to the host, and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <i>A</i> .
<b>n</b>	number of columns of matrix <i>A</i> .
<b>nnz</b>	number of nonzero elements of matrix <i>A</i> .
<b>csrVal</b>	<type> array of <b>nnz</b> (= <b>csrRowPtr</b> ( <b>m</b> ) - <b>csrRowPtr</b> (0) ) nonzero elements of matrix <i>A</i> .
<b>csrRowPtr</b>	integer array of <b>m</b> +1 elements that contains the start of every row and the end of the last row plus one.

<b>csrColInd</b>	integer array of <b>nnz</b> ( $= \text{csrRowPtr}(m) - \text{csrRowPtr}(0)$ ) column indices of the nonzero elements of matrix <i>A</i> .
<b>copyValues</b>	CUSPARSE_ACTION_SYMBOLIC or CUSPARSE_ACTION_NUMERIC.
<b>idxBase</b>	CUSPARSE_INDEX_BASE_ZERO or CUSPARSE_INDEX_BASE_ONE.

## Output

<b>cscVal</b>	<type> array of <b>nnz</b> ( $= \text{cscColPtr}(n) - \text{cscColPtr}(0)$ ) nonzero elements of matrix <i>A</i> . It is only filled in if <b>copyValues</b> is set to CUSPARSE_ACTION_NUMERIC.
<b>cscRowInd</b>	integer array of <b>nnz</b> ( $= \text{cscColPtr}(n) - \text{cscColPtr}(0)$ ) column indices of the nonzero elements of matrix <i>A</i> .
<b>cscColPtr</b>	integer array of <b>n+1</b> elements that contains the start of every column and the end of the last column plus one.

## Status Returned

CUSPARSE_STATUS_SUCCESS	the operation completed successfully.
CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( $m, n, nnz < 0$ ).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU.
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.

## 11.15. `cusparse<t>csr2dense()`

```

cusparseStatus_t cusparseScsr2dense(cusparseHandle_t handle,
                                   int m,
                                   int n,
                                   const cusparseMatDescr_t descrA,
                                   const float *csrValA,
                                   const int *csrRowPtrA,
                                   const int *csrColIndA,
                                   float *A,
                                   int lda)

cusparseStatus_t cusparseDcsr2dense(cusparseHandle_t handle,
                                   int m,
                                   int n,
                                   const cusparseMatDescr_t descrA,
                                   const double *csrValA,
                                   const int *csrRowPtrA,
                                   const int *csrColIndA,
                                   double *A,
                                   int lda)

cusparseStatus_t cusparseCcsr2dense(cusparseHandle_t handle,
                                   int m,
                                   int n,
                                   const cusparseMatDescr_t descrA,
                                   const cuComplex *csrValA,
                                   const int *csrRowPtrA,
                                   const int *csrColIndA,
                                   cuComplex *A,
                                   int lda)

cusparseStatus_t cusparseZcsr2dense(cusparseHandle_t handle,
                                   int m,
                                   int n,
                                   const cusparseMatDescr_t descrA,
                                   const cuDoubleComplex *csrValA,
                                   const int *csrRowPtrA,
                                   const int *csrColIndA,
                                   cuDoubleComplex *A,
                                   int lda)

```

This function converts the sparse matrix in CSR format (that is defined by the three arrays **csrValA**, **csrRowPtrA**, and **csrColIndA**) into the matrix **A** in dense format. The dense matrix **A** is filled in with the values of the sparse matrix and with zeros elsewhere.

This function requires no extra storage. It is executed asynchronously with respect to the host, and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>A</b> .

<b>descrA</b>	the descriptor of matrix <i>A</i> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>csrValA</b>	<type> array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> nonzero elements of matrix <i>A</i> .
<b>csrRowPtrA</b>	integer array of <code>m+1</code> elements that contains the start of every row and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <code>nnz (= csrRowPtrA(m) - csrRowPtrA(0) )</code> column indices of the nonzero elements of matrix <i>A</i> .
<b>lda</b>	leading dimension of array matrixA.

## Output

<b>A</b>	array of dimensions <code>(lda,n)</code> that is filled in with the values of the sparse matrix.
----------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m,n&lt;0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 11.16. `cusparse<t>csr2hyb()`

```

cusparseStatus_t
cusparseScsr2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const float *csrValA,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)
cusparseStatus_t
cusparseDcsr2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const double *csrValA,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)
cusparseStatus_t
cusparseCcsr2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const cuComplex *csrValA,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)
cusparseStatus_t
cusparseZcsr2hyb(cusparseHandle_t handle, int m, int n,
                 const cusparseMatDescr_t descrA,
                 const cuDoubleComplex *csrValA,
                 const int *csrRowPtrA, const int *csrColIndA,
                 cusparseHybMat_t hybA, int userEllWidth,
                 cusparseHybPartition_t partitionType)

```

This function converts a sparse matrix in CSR format into a sparse matrix in HYB format. It assumes that the **hybA** parameter has been initialized with **cusparseCreateHybMat()** routine before calling this function.

This function requires some amount of temporary storage and a significant amount of storage for the matrix in HYB format. It is executed asynchronously with respect to the host and may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>csrValA</b>	<type> array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) nonzero elements of matrix <b>A</b> .
<b>csrRowPtrA</b>	integer array of <b>m+1</b> elements that contains the start of every row and the end of the last row plus one.

<code>csrColIndA</code>	integer array of <code>nnz</code> ( <code>= csrRowPtrA(m) - csrRowPtrA(0)</code> ) column indices of the nonzero elements of matrix <b>A</b> .
<code>userEllWidth</code>	width of the regular (ELL) part of the matrix in HYB format, which should be less than maximum number of nonzeros per row and is only required if <code>partitionType == CUSPARSE_HYB_PARTITION_USER</code> .
<code>partitionType</code>	partitioning method to be used in the conversion (please refer to <code>cusparseHybPartition_t</code> for details).

## Output

<code>hybA</code>	the matrix <b>A</b> in HYB storage format.
-------------------	--

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, n &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU.
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 11.17. `cusparse<t>dense2csc`

```

cusparseStatus_t
cusparseSdense2csc(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const float *A,
                  int lda, const int *nnzPerCol,
                  float *cscValA,
                  int *cscRowIndA, int *cscColPtrA)

cusparseStatus_t
cusparseDdense2csc(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const double *A,
                  int lda, const int *nnzPerCol,
                  double *cscValA,
                  int *cscRowIndA, int *cscColPtrA)

cusparseStatus_t
cusparseCdense2csc(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const cuComplex *A,
                  int lda, const int *nnzPerCol,
                  cuComplex *cscValA,
                  int *cscRowIndA, int *cscColPtrA)

cusparseStatus_t
cusparseZdense2csc(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const cuDoubleComplex *A,
                  int lda, const int *nnzPerCol,
                  cuDoubleComplex *cscValA,
                  int *cscRowIndA, int *cscColPtrA)

```

This function converts the matrix **A** in dense format into a sparse matrix in CSC format. All the parameters are assumed to have been pre-allocated by the user and the arrays are filled in based on **nnzPerCol**, which can be pre-computed with `cusparse<t>nnz()`.

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <i>A</i> .
<b>n</b>	number of columns of matrix <i>A</i> .
<b>descrA</b>	the descriptor of matrix <i>A</i> . The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>A</b>	array of dimensions ( <i>lda</i> , <i>n</i> ).
<b>lda</b>	leading dimension of dense array <i>A</i> .
<b>nnzPerCol</b>	array of size <i>n</i> containing the number of non-zero elements per column.

## Output

<b>cscValA</b>	<type> array of <b>nnz</b> (= <b>cscRowPtrA</b> ( <b>m</b> ) - <b>cscRowPtrA</b> (0) ) non-zero elements of matrix <i>A</i> . It is only filled-in if <b>copyValues</b> is set to <b>CUSPARSE_ACTION_NUMERIC</b> .
<b>cscRowIndA</b>	integer array of <b>nnz</b> (= <b>cscRowPtrA</b> ( <b>m</b> ) - <b>cscRowPtrA</b> (0) ) row indices of the non-zero elements of matrix <i>A</i> .
<b>cscColPtrA</b>	integer array of <b>n+1</b> elements that contains the start of every column and the end of the last column plus one.

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>n</b> <0).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 11.18. cusparse<t>dense2csr

```

cusparseStatus_t
cusparseSdense2csr(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const float *A,
                  int lda, const int *nnzPerRow,
                  float *csrValA,
                  int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseDdense2csr(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const double *A,
                  int lda, const int *nnzPerRow,
                  double *csrValA,
                  int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseCdense2csr(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const cuComplex *A,
                  int lda, const int *nnzPerRow,
                  cuComplex *csrValA,
                  int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseZdense2csr(cusparseHandle_t handle, int m, int n,
                  const cusparseMatDescr_t descrA,
                  const cuDoubleComplex *A,
                  int lda, const int *nnzPerRow,
                  cuDoubleComplex *csrValA,
                  int *csrRowPtrA, int *csrColIndA)

```

This function converts the matrix **A** in dense format into a sparse matrix in CSR format. All the parameters are assumed to have been pre-allocated by the user and the arrays are filled in based on the **nnzPerRow**, which can be pre-computed with **cusparselt>nnz()**.

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <i>A</i> .
<b>n</b>	number of columns of matrix <i>A</i> .
<b>descrA</b>	the descriptor of matrix <i>A</i> . The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> . Also, the supported index bases are <b>CUSPARSE_INDEX_BASE_ZERO</b> and <b>CUSPARSE_INDEX_BASE_ONE</b> .
<b>A</b>	array of dimensions ( <b>lda</b> , <b>n</b> ).
<b>lda</b>	leading dimension of dense array <i>A</i> .
<b>nnzPerRow</b>	array of size <b>n</b> containing the number of non-zero elements per row.

### Output

<b>csrValA</b>	<type> array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) non-zero elements of matrix <i>A</i> .
<b>csrRowPtrA</b>	integer array of <b>m+1</b> elements that contains the start of every column and the end of the last column plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <b>m</b> ) - <b>csrRowPtrA</b> (0) ) column indices of the non-zero elements of matrix <i>A</i> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>n</b> < 0).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 11.19. `cusparse<t>dense2hyb`

```

cusparseStatus_t
cusparseSdense2hyb(cusparseHandle_t handle, int m, int n,
                   const cusparseMatDescr_t descrA,
                   const float *A,
                   int lda, const int *nnzPerRow, cusparseHybMat_t hybA,
                   int userEllWidth,
                   cusparseHybPartition_t partitionType)

cusparseStatus_t
cusparseDdense2hyb(cusparseHandle_t handle, int m, int n,
                   const cusparseMatDescr_t descrA,
                   const double *A,
                   int lda, const int *nnzPerRow, cusparseHybMat_t
                   hybA,
                   int userEllWidth,
                   cusparseHybPartition_t partitionType)

cusparseStatus_t
cusparseCdense2hyb(cusparseHandle_t handle, int m, int n,
                   const cusparseMatDescr_t descrA,
                   const cuComplex *A,
                   int lda, const int *nnzPerRow, cusparseHybMat_t hybA,
                   int userEllWidth,
                   cusparseHybPartition_t partitionType)

cusparseStatus_t
cusparseZdense2hyb(cusparseHandle_t handle, int m, int n,
                   const cusparseMatDescr_t descrA,
                   const cuDoubleComplex *A,
                   int lda, const int *nnzPerRow, cusparseHybMat_t hybA,
                   int userEllWidth,
                   cusparseHybPartition_t partitionType)

```

This function converts the matrix **A** in dense format into a sparse matrix in HYB format. It assumes that the routine **`cusparseCreateHybMat`** was used to initialize the opaque structure **`hybA`** and that the array **`nnzPerRow`** was pre-computed with **`cusparse<t>nnz()`**.

This function requires some amount of temporary storage and a significant amount of storage for the matrix in HYB format. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>m</b>	number of rows of matrix <b>A</b> .
<b>n</b>	number of columns of matrix <b>A</b> .
<b>descrA</b>	the descriptor of matrix <b>A</b> . The supported matrix type is <b><code>CUSPARSE_MATRIX_TYPE_GENERAL</code></b> .
<b>A</b>	array of dimensions <b>(lda, n)</b> .
<b>lda</b>	leading dimension of dense array <b>A</b> .
<b>nnzPerRow</b>	array of size <b>m</b> containing the number of non-zero elements per row.

<b>userEllWidth</b>	width of the regular (ELL) part of the matrix in HYB format, which should be less than maximum number of non-zeros per row and is only required if <b>partitionType</b> == <b>CUSPARSE_HYB_PARTITION_USER</b> .
<b>partitionType</b>	partitioning method to be used in the conversion (please refer to <b>cusparseHybPartition_t</b> on page ?? for details).

## Output

<b>hybA</b>	the matrix <b>A</b> in HYB storage format.
-------------	--

## Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_ALLOC_FAILED</b>	the resources could not be allocated.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	invalid parameters were passed ( <b>m</b> , <b>n</b> < 0).
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU
<b>CUSPARSE_STATUS_INTERNAL_ERROR</b>	an internal operation failed.
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 11.20. cusparse<t>hyb2csc

```

cusparseStatus_t
cusparseShyb2csc(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 float *cscValA, int *cscRowIndA, int *cscColPtrA)

cusparseStatus_t
cusparseDhyb2csc(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,

                 double *cscValA, int *cscRowIndA, int *cscColPtrA)

cusparseStatus_t
cusparseChyb2csc(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 cuComplex *cscValA, int *cscRowIndA, int *cscColPtrA)

cusparseStatus_t
cusparseZhyb2csc(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 cuDoubleComplex *cscValA, int *cscRowIndA, int
                 *cscColPtrA)

```

This function converts a sparse matrix in HYB format into a sparse matrix in CSC format.

This function requires some amount of temporary storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>descrA</b>	the descriptor of matrix <i>A</i> in Hyb format. The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> .
<b>hybA</b>	the matrix <i>A</i> in HYB storage format.

### Output

<b>cscValA</b>	<type> array of <code>nnz (= cscColPtrA(m) - cscColPtrA(0) )</code> non-zero elements of matrix <i>A</i> .
<b>cscRowIndA</b>	integer array of <code>nnz (= cscColPtrA(m) - cscColPtrA(0) )</code> column indices of the non-zero elements of matrix <i>A</i> .
<b>cscColPtrA</b>	integer array of <code>m+1</code> elements that contains the start of every column and the end of the last row plus one.

### Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <code>m, n &lt; 0</code> ).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

## 11.21. cusparse<t>hyb2csr

```

cusparseStatus_t
cusparseShyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 float      *csrValA, int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseDhyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 double     *csrValA, int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseChyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 cuComplex  *csrValA, int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseZhyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 cuDoubleComplex *csrValA, int *csrRowPtrA, int
                 *csrColIndA)

```

This function converts a sparse matrix in HYB format into a sparse matrix in CSR format.

This function requires some amount of temporary storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>descrA</b>	the descriptor of matrix <i>A</i> in Hyb format. The supported matrix type is <b>CUSPARSE_MATRIX_TYPE_GENERAL</b> .
<b>hybA</b>	the matrix <i>A</i> in HYB storage format.

### Output

<b>csrValA</b>	<type> array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <i>m</i> ) - <b>csrRowPtrA</b> (0) ) non-zero elements of matrix <i>A</i> .
<b>csrRowPtrA</b>	integer array of <i>m</i> +1 elements that contains the start of every column and the end of the last row plus one.
<b>csrColIndA</b>	integer array of <b>nnz</b> (= <b>csrRowPtrA</b> ( <i>m</i> ) - <b>csrRowPtrA</b> (0) ) column indices of the non-zero elements of matrix <i>A</i> .

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
--------------------------------	---------------------------------------

CUSPARSE_STATUS_NOT_INITIALIZED	the library was not initialized.
CUSPARSE_STATUS_ALLOC_FAILED	the resources could not be allocated.
CUSPARSE_STATUS_INVALID_VALUE	invalid parameters were passed ( $m, n < 0$ ).
CUSPARSE_STATUS_ARCH_MISMATCH	the device does not support double precision.
CUSPARSE_STATUS_EXECUTION_FAILED	the function failed to launch on the GPU
CUSPARSE_STATUS_INTERNAL_ERROR	an internal operation failed.
CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED	the matrix type is not supported.

## 11.22. `cusparse<t>hyb2dense`

```

cusparseStatus_t
cusparseShyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 float *csrValA, int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseDhyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 double *csrValA, int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseChyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 cuComplex *csrValA, int *csrRowPtrA, int *csrColIndA)

cusparseStatus_t
cusparseZhyb2csr(cusparseHandle_t handle,
                 const cusparseMatDescr_t descrA,
                 const cusparseHybMat_t hybA,
                 cuDoubleComplex *csrValA, int *csrRowPtrA, int
                 *csrColIndA)

```

This function converts a sparse matrix in HYB format (contained in the opaque structure ) into a matrix **A** in dense format. The dense matrix **A** is filled in with the values of the sparse matrix and with zeros elsewhere.

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>descrA</b>	the descriptor of matrix <b>A</b> in Hyb format. The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> .
<b>hybA</b>	the matrix <b>A</b> in HYB storage format.
<b>lda</b>	leading dimension of dense array <b>A</b> .

### Output

<b>A</b>	array of dimensions ( <b>lda</b> , <b>n</b> ) that is filled in with the values of the sparse matrix.
----------	---

### Status Returned

<b>CUSPARSE_STATUS_SUCCESS</b>	the operation completed successfully.
<b>CUSPARSE_STATUS_NOT_INITIALIZED</b>	the library was not initialized.
<b>CUSPARSE_STATUS_INVALID_VALUE</b>	the internally stored hyb format parameters are invalid.
<b>CUSPARSE_STATUS_ARCH_MISMATCH</b>	the device does not support double precision.
<b>CUSPARSE_STATUS_EXECUTION_FAILED</b>	the function failed to launch on the GPU
<b>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</b>	the matrix type is not supported.

## 11.23. `cusparse<T>nnz`

```

cusparseStatus_t
cusparseSnnz(cusparseHandle_t handle, cusparseDirection_t dirA, int m,
             int n, const cusparseMatDescr_t descrA,
             const float *A,
             int lda, int *nnzPerRowColumn, int *nnzTotalDevHostPtr)
cusparseStatus_t
cusparseDnnz(cusparseHandle_t handle, cusparseDirection_t dirA, int m,
             int n, const cusparseMatDescr_t descrA,
             const double *A,
             int lda, int *nnzPerRowColumn, int *nnzTotalDevHostPtr)
cusparseStatus_t
cusparseCnnz(cusparseHandle_t handle, cusparseDirection_t dirA, int m,
             int n, const cusparseMatDescr_t descrA,
             const cuComplex *A,
             int lda, int *nnzPerRowColumn, int *nnzTotalDevHostPtr)
cusparseStatus_t
cusparseZnnz(cusparseHandle_t handle, cusparseDirection_t dirA, int m,
             int n, const cusparseMatDescr_t descrA,
             const cuDoubleComplex *A,
             int lda, int *nnzPerRowColumn, int *nnzTotalDevHostPtr)

```

This function computes the number of non-zero elements per row or column and the total number of non-zero elements in a dense matrix.

This function requires no extra storage. It is executed asynchronously with respect to the host and it may return control to the application on the host before the result is ready.

### Input

<b>handle</b>	handle to the cuSPARSE library context.
<b>dirA</b>	direction that specifies whether to count non-zero elements by <b>CUSPARSE_DIRECTION_ROW</b> or <b>CUSPARSE_DIRECTION_COLUMN</b> .
<b>m</b>	number of rows of matrix <i>A</i> .
<b>n</b>	number of columns of matrix <i>A</i> .

<b>descrA</b>	the descriptor of matrix <i>A</i> in Hyb format. The supported matrix type is <code>CUSPARSE_MATRIX_TYPE_GENERAL</code> . Also, the supported index bases are <code>CUSPARSE_INDEX_BASE_ZERO</code> and <code>CUSPARSE_INDEX_BASE_ONE</code> .
<b>A</b>	array of dimensions ( <i>lda</i> , <i>n</i> ).
<b>lda</b>	leading dimension of dense array <i>A</i> .

## Output

<b>nnzPerRowColumn</b>	array of size <i>m</i> or <i>n</i> containing the number of non-zero elements per row or column, respectively.
<b>nnzTotalDevHostPtr</b>	total number of non-zero elements in device or host memory.

## Status Returned

<code>CUSPARSE_STATUS_SUCCESS</code>	the operation completed successfully.
<code>CUSPARSE_STATUS_NOT_INITIALIZED</code>	the library was not initialized.
<code>CUSPARSE_STATUS_ALLOC_FAILED</code>	the resources could not be allocated.
<code>CUSPARSE_STATUS_INVALID_VALUE</code>	invalid parameters were passed ( <i>m</i> , <i>n</i> < 0).
<code>CUSPARSE_STATUS_ARCH_MISMATCH</code>	the device does not support double precision.
<code>CUSPARSE_STATUS_EXECUTION_FAILED</code>	the function failed to launch on the GPU
<code>CUSPARSE_STATUS_INTERNAL_ERROR</code>	an internal operation failed.
<code>CUSPARSE_STATUS_MATRIX_TYPE_NOT_SUPPORTED</code>	the matrix type is not supported.

# Chapter 12.

## APPENDIX A: CUSPARSE LIBRARY C++ EXAMPLE

For sample code reference please see the example code below. It shows an application written in C++ using the cuSPARSE library API. The code performs the following actions:

1. Creates a sparse test matrix in COO format.
2. Creates a sparse and dense vector.
3. Allocates GPU memory and copies the matrix and vectors into it.
4. Initializes the cuSPARSE library.
5. Creates and sets up the matrix descriptor.
6. Converts the matrix from COO to CSR format.
7. Exercises Level 1 routines.
8. Exercises Level 2 routines.
9. Exercises Level 3 routines.
10. Destroys the matrix descriptor.

11. Releases resources allocated for the cuSPARSE library.

```

//Example: Application using C++ and the CUSPARSE library
//-----
#include <stdio.h>
#include <stdlib.h>
#include <cuda_runtime.h>
#include "cusparse.h"

#define CLEANUP(s) \
do { \
    printf ("%s\n", s); \
    if (yHostPtr) free(yHostPtr); \
    if (zHostPtr) free(zHostPtr); \
    if (xIndHostPtr) free(xIndHostPtr); \
    if (xValHostPtr) free(xValHostPtr); \
    if (cooRowIndexHostPtr) free(cooRowIndexHostPtr); \
    if (cooColIndexHostPtr) free(cooColIndexHostPtr); \
    if (cooValHostPtr) free(cooValHostPtr); \
    if (y) cudaFree(y); \
    if (z) cudaFree(z); \
    if (xInd) cudaFree(xInd); \
    if (xVal) cudaFree(xVal); \
    if (csrRowPtr) cudaFree(csrRowPtr); \
    if (cooRowIndex) cudaFree(cooRowIndex); \
    if (cooColIndex) cudaFree(cooColIndex); \
    if (cooVal) cudaFree(cooVal); \
    if (descr) cusparseDestroyMatDescr(descr); \
    if (handle) cusparseDestroy(handle); \
    cudaDeviceReset(); \
    fflush (stdout); \
} while (0)

int main(){
    cudaError_t cudaStat1,cudaStat2,cudaStat3,cudaStat4,cudaStat5,cudaStat6;
    cusparseStatus_t status;
    cusparseHandle_t handle=0;
    cusparseMatDescr_t descr=0;
    int * cooRowIndexHostPtr=0;
    int * cooColIndexHostPtr=0;
    double * cooValHostPtr=0;
    int * cooRowIndex=0;
    int * cooColIndex=0;
    double * cooVal=0;
    int * xIndHostPtr=0;
    double * xValHostPtr=0;
    double * yHostPtr=0;
    int * xInd=0;

    }
    cooRowIndexHostPtr[0]=0; cooColIndexHostPtr[0]=0; cooValHostPtr[0]=1.0;
    cooRowIndexHostPtr[1]=0; cooColIndexHostPtr[1]=2; cooValHostPtr[1]=2.0;
    cooRowIndexHostPtr[2]=0; cooColIndexHostPtr[2]=3; cooValHostPtr[2]=3.0;

```

# Chapter 13.

## APPENDIX B: CUSPARSE FORTRAN BINDINGS

The cuSPARSE library is implemented using the C-based CUDA toolchain, and it thus provides a C-style API that makes interfacing to applications written in C or C++ trivial. There are also many applications implemented in Fortran that would benefit from using cuSPARSE, and therefore a cuSPARSE Fortran interface has been developed.

Unfortunately, Fortran-to-C calling conventions are not standardized and differ by platform and toolchain. In particular, differences may exist in the following areas:

- Symbol names (capitalization, name decoration)

- Argument passing (by value or reference)

- Passing of pointer arguments (size of the pointer)

To provide maximum flexibility in addressing those differences, the cuSPARSE Fortran interface is provided in the form of wrapper functions, which are written in C and are located in the file `cusparse_fortran.c`. This file also contains a few additional wrapper functions (for `cudaMalloc()`, `cudaMemset`, and so on) that can be used to allocate memory on the GPU.

The cuSPARSE Fortran wrapper code is provided as an example only and needs to be compiled into an application for it to call the cuSPARSE API functions. Providing this source code allows users to make any changes necessary for a particular platform and toolchain.

The cuSPARSE Fortran wrapper code has been used to demonstrate interoperability with the compilers g95 0.91 (on 32-bit and 64-bit Linux) and g95 0.92 (on 32-bit and 64-bit Mac OS X). In order to use other compilers, users have to make any changes to the wrapper code that may be required.

The direct wrappers, intended for production code, substitute device pointers for vector and matrix arguments in all cuSPARSE functions. To use these interfaces, existing applications need to be modified slightly to allocate and deallocate data structures in GPU memory space (using `CUDA_MALLOC()` and `CUDA_FREE()`) and to copy data between GPU and CPU memory spaces (using the `CUDA_MEMCPY()` routines). The sample wrappers provided in `cusparse_fortran.c` map device pointers to the OS-

dependent type `size_t`, which is 32 bits wide on 32-bit platforms and 64 bits wide on a 64-bit platforms.

One approach to dealing with index arithmetic on device pointers in Fortran code is to use C-style macros and to use the C preprocessor to expand them. On Linux and Mac OS X, preprocessing can be done by using the option '`-cpp`' with g95 or gfortran. The function `GET_SHIFTED_ADDRESS()`, provided with the cuSPARSE Fortran wrappers, can also be used, as shown in example B.

Example B shows the the C++ of example A implemented in Fortran 77 on the host. This example should be compiled with `ARCH_64` defined as 1 on a 64-bit OS system and as undefined on a 32-bit OS system. For example, on g95 or gfortran, it can be done directly on the command line using the option `-cpp -DARCH_64=1`.

## 13.1. Example B, Fortran Application

```

c      #define ARCH_64 0
c      #define ARCH_64 1

      program cusparse_fortran_example
      implicit none
      integer cuda_malloc
      external cuda_free
      integer cuda_memcpy_c2fort_int
      integer cuda_memcpy_c2fort_real
      integer cuda_memcpy_fort2c_int
      integer cuda_memcpy_fort2c_real
      integer cuda_memset
      integer cusparse_create
      external cusparse_destroy
      integer cusparse_get_version
      integer cusparse_create_mat_descr
      external cusparse_destroy_mat_descr
      integer cusparse_set_mat_type
      integer cusparse_get_mat_type
      integer cusparse_get_mat_fill_mode
      integer cusparse_get_mat_diag_type
      integer cusparse_set_mat_index_base
      integer cusparse_get_mat_index_base
